

# **DEPARTMENT OF INFORMATION SCIENCE**

## **COMPUTER NETWORK LAB EXPERIMENTS**

### **Module-1**

#### **DOS Commands**

##### **1.PING Command**

How to check internet connection in CMD

To check whether your internet connection works, you can use Command Prompt to test your connection to a certain website or internet location. To do that, you can use the ping network command, followed by a web address or IP address. For instance, you can check the connectivity to GOOGLE without opening a web browser, by typing the command " ping www.google.com." Then press Enter on your keyboard.

Ping is used to check the connectivity with other devices on the network, for example computers, routers, switches etc. Select Start > Programs > Accessories > Command Prompt. This will give you a window like the one below.

Type *C:\>ping x.x.x.x*

By default, ping sends four ICMP Echo Request packets each of 32 bytes. The response packets are called ICMP Echo Reply Packets.

The screenshot shows a Microsoft Windows Command Prompt window. The title bar reads "C:\WINDOWS\system32\cmd.exe". The window displays the following text:

```
Microsoft Windows [Version 5.2.3790]
(C) Copyright 1985-2003 Microsoft Corp.

C:\Documents and Settings\Administrator>ping 155.0.0.24

Pinging 155.0.0.24 with 32 bytes of data:
Reply from 155.0.0.24: bytes=32 time<1ms TTL=128

Ping statistics for 155.0.0.24:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 0ms, Average = 0ms
```

**Fig : The Ping Command**

Now Type *C:\>ping x.x.x.x -t*

- The ping command also allows you to use the handy "-t" parameter, which enables you to ping the specified address forever until it's manually stopped. For instance, we typed "ping -t www.digitalcitizen.life." After some time, we wanted to see some connection statistics and we used the keyboard combination "CTRL + Break." This shows the averages of the ping commands run until then.
- "-t" switch will continue to send packets to the destination until user stops this by pressing *Ctrl + C*

```
C:\Users\Codrut Neagu>ping www.digitalcitizen.life -t
Pinging www.digitalcitizen.life [2606:4700:20::681a:cfc] with 32 bytes of data:
Reply from 2606:4700:20::681a:cfc: time=10ms
Reply from 2606:4700:20::681a:cfc: time=85ms
Reply from 2606:4700:20::681a:cfc: time=10ms

## 2. IPCONFIG Command

How can I see all the network adapters on my computer using CMD?

To obtain detailed information about your network adapters and connections, use the ipconfig command. Open Command Prompt, type ipconfig, and press Enter. As you can see in the

screenshot below, when you run this command, Windows displays the list of all the active network devices, whether they're connected or disconnected, and their IP addresses. You also get details such as their default gateway IP addresses, subnet masks and the state of each network adapter.

```
Command Prompt

C:\Users\Codrut Neagu>ipconfig

Windows IP Configuration

Ethernet adapter Ethernet:

  Connection-specific DNS Suffix . . . .
  IPv6 Address . . . . . : 2a02:2f01:730a:1300:107c:de5c:5f89:c00a
  Temporary IPv6 Address . . . . . : 2a02:2f01:730a:1300:254b:7d03:4a72:9b5c
  Link-local IPv6 Address . . . . . : fe80::107c:de5c:5f89:c00a%20
  IPv4 Address . . . . . : 192.168.50.239
  Subnet Mask . . . . . : 255.255.255.0
  Default Gateway . . . . . : fe80::6d9:f5ff:feb5:b1f0%20
                           192.168.50.1

Wireless LAN adapter Wi-Fi:

  Media State . . . . . : Media disconnected
  Connection-specific DNS Suffix . . .

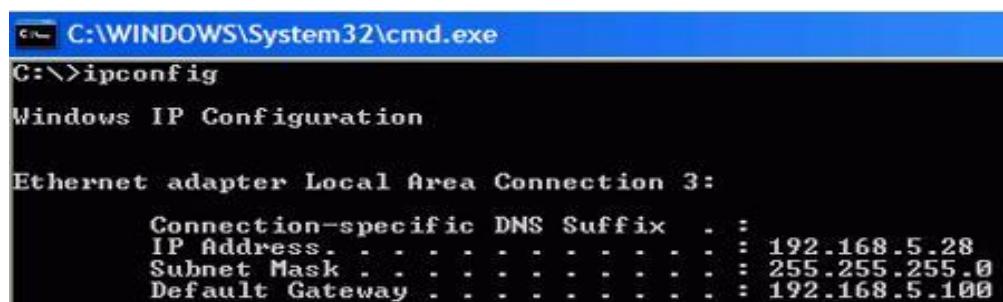

Wireless LAN adapter Local Area Connection* 9:

  Media State . . . . . : Media disconnected
  Connection-specific DNS Suffix . . .

C:\Users\Codrut Neagu>
```

Displays full TCP/IP configuration of all network adapters (Ethernet cards) installed in your system. Type the following command in the command prompt.

*C:\ipconfig*

```
C:\WINDOWS\System32\cmd.exe
C:\>ipconfig /all

Windows IP Configuration

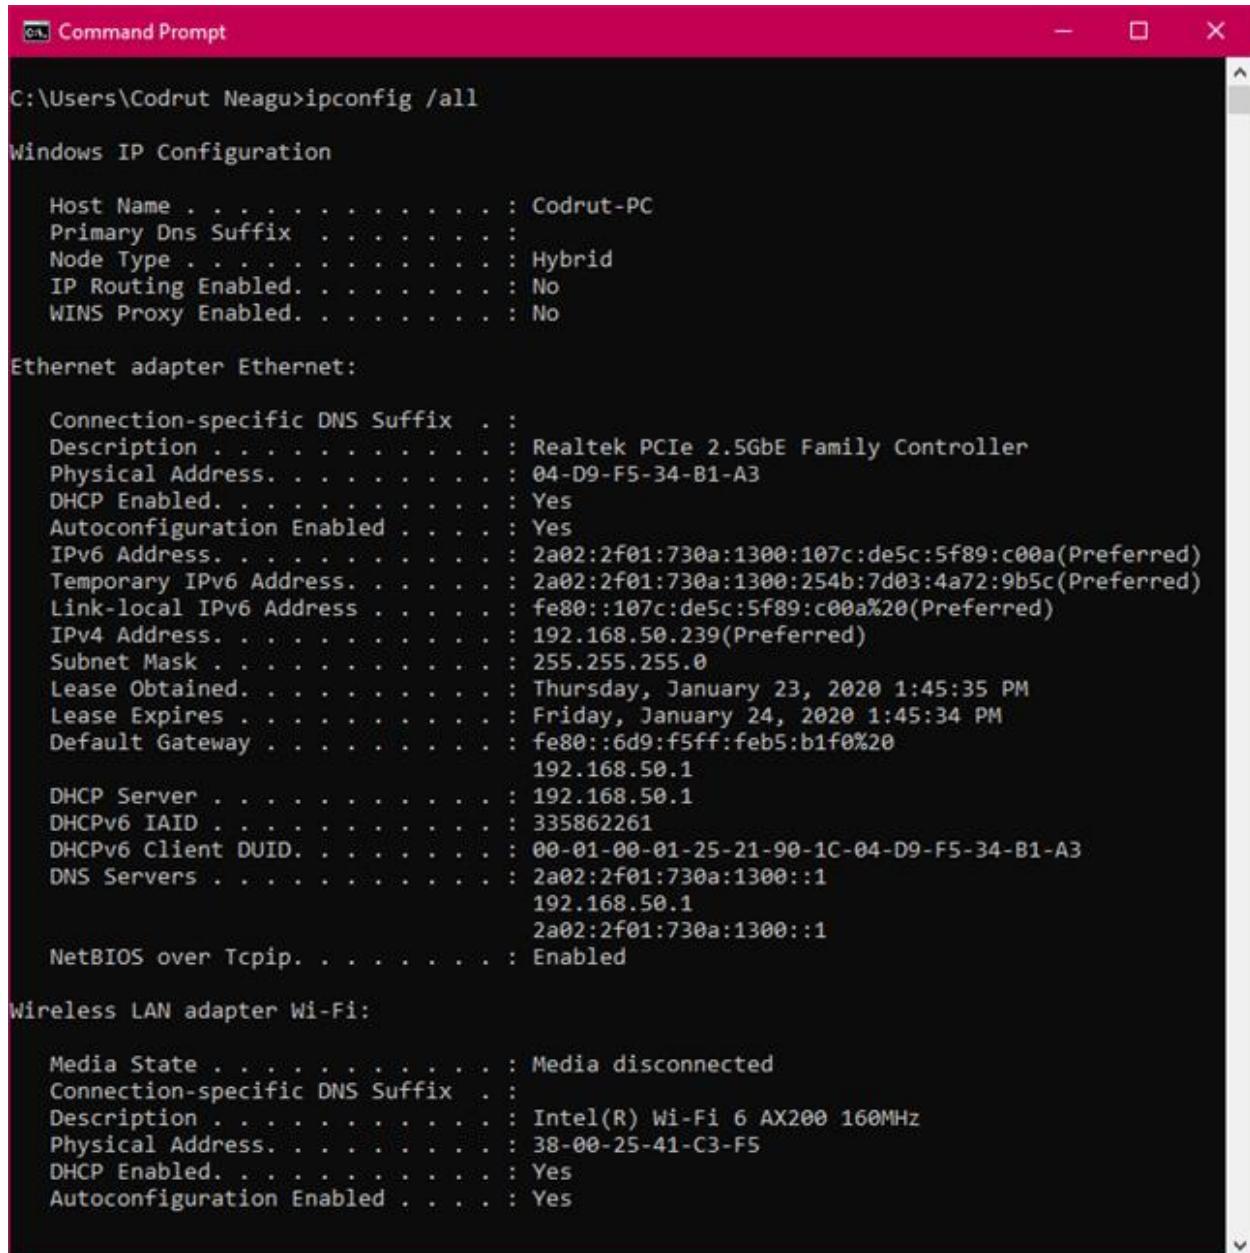

Ethernet adapter Local Area Connection 3:

  Connection-specific DNS Suffix . . .
  IP Address . . . . . : 192.168.5.28
  Subnet Mask . . . . . : 255.255.255.0
  Default Gateway . . . . . : 192.168.5.100
```

Figure 2: The IPCONFIG Command

Now type *C:\ipconfig /all*

If you add the /all switch to the ipconfig command, you can get to a whole new level of detail: DNS information, the MAC (Media Access Control) (in the Physical Address field), and other information about each network component. Check out the picture below to see a sample of what you get from the "ipconfig /all" command.

```
C:\Users\Codrut Neagu>ipconfig /all

Windows IP Configuration

Host Name . . . . . : Codrut-PC
Primary Dns Suffix . . . . . :
Node Type . . . . . : Hybrid
IP Routing Enabled. . . . . : No
WINS Proxy Enabled. . . . . : No

Ethernet adapter Ethernet:

Connection-specific DNS Suffix . . . . . :
Description . . . . . : Realtek PCIe 2.5GbE Family Controller
Physical Address. . . . . : 04-D9-F5-34-B1-A3
DHCP Enabled. . . . . : Yes
Autoconfiguration Enabled . . . . . : Yes
IPv6 Address. . . . . : 2a02:2f01:730a:1300:107c:de5c:5f89:c00a(PREFERRED)
Temporary IPv6 Address. . . . . : 2a02:2f01:730a:1300:254b:7d03:4a72:9b5c(PREFERRED)
Link-local IPv6 Address . . . . . : fe80::107c:de5c:5f89:c00a%20(PREFERRED)
IPv4 Address. . . . . : 192.168.50.239(PREFERRED)
Subnet Mask . . . . . : 255.255.255.0
Lease Obtained. . . . . : Thursday, January 23, 2020 1:45:35 PM

Default Gateway . . . . . : fe80::6d9:f5ff:feb5:b1f0%20
                           192.168.50.1
DHCP Server . . . . . : 192.168.50.1
DHCPv6 IAID . . . . . : 335862261
DHCPv6 Client DUID. . . . . : 00-01-00-01-25-21-90-1C-04-D9-F5-34-B1-A3
DNS Servers . . . . . : 2a02:2f01:730a:1300::1
                           192.168.50.1
                           2a02:2f01:730a:1300::1
NetBIOS over Tcpip. . . . . : Enabled

Wireless LAN adapter Wi-Fi:

Media State . . . . . : Media disconnected
Connection-specific DNS Suffix . . . . . :
Description . . . . . : Intel(R) Wi-Fi 6 AX200 160MHz
Physical Address. . . . . : 38-00-25-41-C3-F5
DHCP Enabled. . . . . : Yes
Autoconfiguration Enabled . . . . . : Yes
```

**Ip config** has a number of switches the most common are:

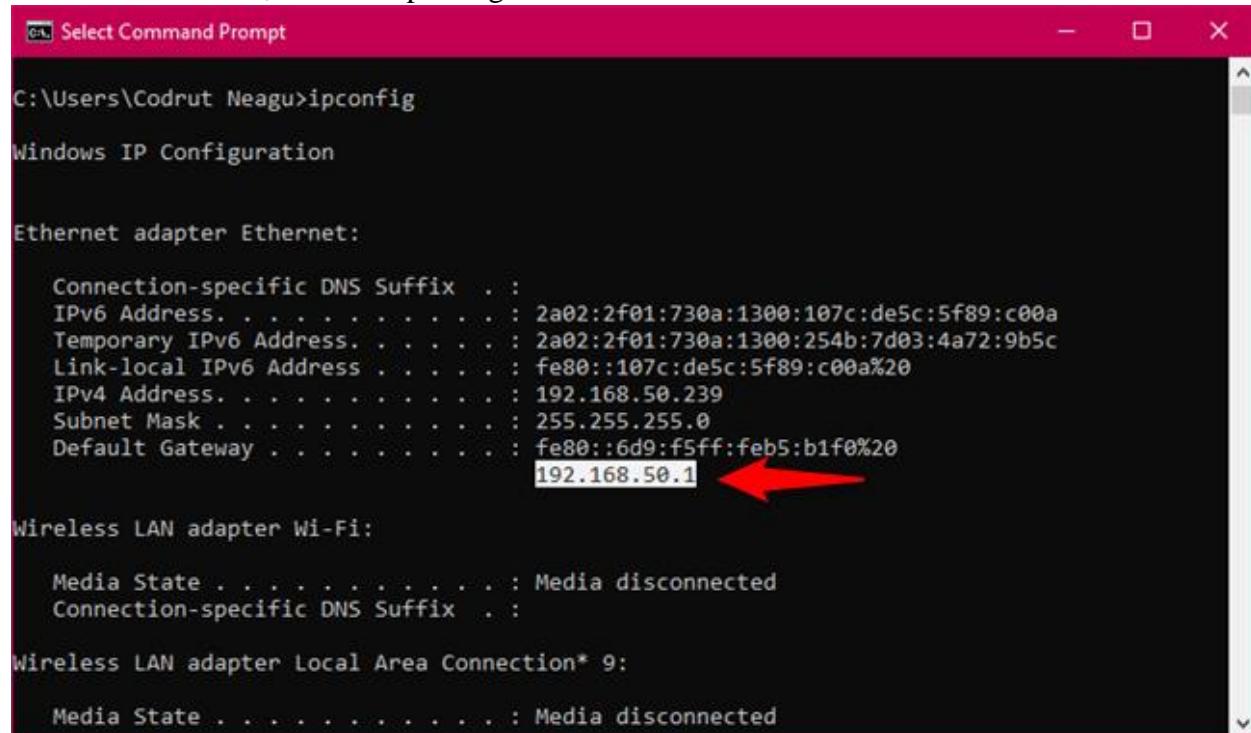

**ipconfig /all** – displays more information about the network setup on your systems including the MAC address.

**ipconfig /release** – release the current IP address

**ipconfig /renew** – renew IP address  
**ipconfig /?** -shows help  
**ipconfig/flushdns** – flush the dns cache

How to check your network connection in CMD

If you want to check whether your network connection to the router is operating as it should, you can use a combination of the commands ipconfig and ping. First, get some cmd nic info about your adapter. In other words, open Command Prompt and run ipconfig. In the list of results, identify the network adapter that's used for connecting to the network you want to test. Then, in its details, find the IP address of your router and note it down. For example, if we'd want to check our Ethernet network connection, we'd run ipconfig and see that our router's IP address is 192.168.50.1.

```
C:\Users\Codrut Neagu>ipconfig

Windows IP Configuration

Ethernet adapter Ethernet:

  Connection-specific DNS Suffix . . . .
  IPv6 Address . . . . . : 2a02:2f01:730a:1300:107c:de5c:5f89:c00a
  Temporary IPv6 Address . . . . . : 2a02:2f01:730a:1300:254b:7d03:4a72:9b5c
  Link-local IPv6 Address . . . . . : fe80::107c:de5c:5f89:c00a%20
  IPv4 Address . . . . . : 192.168.50.239
  Subnet Mask . . . . . : 255.255.255.0
  Default Gateway . . . . . : fe80::6d9:f5ff:feb5:b1f0%20
                           192.168.50.1

Wireless LAN adapter Wi-Fi:

  Media State . . . . . . . . . : Media disconnected
  Connection-specific DNS Suffix . . . .

Wireless LAN adapter Local Area Connection* 9:

  Media State . . . . . . . . . : Media disconnected
```

Figure :Running ipconfig to identify the IP address of the router

The next step is to check that the network connection between the router and the computer is OK. To do that, it's enough to run the ping command on the router's IP address. In our example, that would mean that we have to run this command in CMD: ping 192.168.50.1.

```
C:\Users\Codrut Neagu>ping 192.168.50.1 ←  
Pinging 192.168.50.1 with 32 bytes of data:  
Reply from 192.168.50.1: bytes=32 time<1ms TTL=64  
  
Ping statistics for 192.168.50.1:  
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss), ←  
Approximate round trip times in milli-seconds:  
    Minimum = 0ms, Maximum = 0ms, Average = 0ms  
  
C:\Users\Codrut Neagu>
```

**Figure:Pinging the router to check the network connection**

If there are no packets lost, then the network connection tested is running well. Otherwise, there's a problem somewhere between your computer and the router, in which case you should check that your PC's network adapter is configured correctly, that the Ethernet cable is OK (if you're using a wired connection), and that the router is configured properly.

How to renew the IP address of your network adapter

When your network connection doesn't work as it should, your network adapter might not have the right IP address assigned. A quick way of trying to solve this issue is to renew its IP address and, fortunately, you can do that quickly, straight from the Command Prompt. Open CMD and run the following commands: ipconfig /release and ipconfig /renew. The first one (ipconfig /release) forces your network adapter to drop its assigned IP address, and the second command (ipconfig /renew) renews the network adapter's IP address.

The screenshot shows two command-line sessions in a Windows Command Prompt window.

**Session 1 (Top):**

```
C:\Users\Codrut Neagu>ipconfig /release
Windows IP Configuration
```

No operation can be performed on Wi-Fi while it has its media disconnected.  
No operation can be performed on Local Area Connection\* 9 while it has its media disconnected.  
No operation can be performed on Local Area Connection\* 10 while it has its media disconnected.

**Ethernet adapter Ethernet:**

### 3 TRACERT Command

Tracert command tells you the path a packet takes from your computer to the destination. It will list all the routers from which a packet passes until it reaches its destination.

C:\tracert google.com

The screenshot shows a command-line session in a Windows Command Prompt window displaying the trace route to google.com.

```
C:\> C:\WINDOWS\system32\cmd.exe
C:\Documents and Settings\Administrator>tracert google.com
Tracing route to google.com [72.14.207.99]
over a maximum of 30 hops:

Trace complete.
C:\Documents and Settings\Administrator>
```

#### **4. NSLOOKUP Command**

Displays the default DNS server information.

Type the following command

*C:\>nslookup*

What is your default DNS server's IP address?

#### **5 . NETSTAT Command**

You can get other useful cmd nic info from the netstat command, which lets you see the network connections that are active between your system and any other systems on your network or the internet.

Displays active TCP and UDP connections.

Practice the following commands

*C:\>netstat*

*C:\>netstat -a*

*C:\>netstat -an*

```
Command Prompt - netstat
Microsoft Windows [Version 10.0.18363.592]

```

*Netstat -a displays the active network connections, open ports and listening ports*

## 6. ARP Command

ARP command corresponds to the Address Resolution Protocol, it is easy to understand of network communications in terms of IP addressing, packet delivery is ultimately dependent on the Media Access Control (MAC) address of the device's network adapter. This is where the Address Resolution Protocol comes into play. Its job is to map IP addresses to MAC addresses.

Windows devices maintain an ARP cache, which contains the results of recent ARP queries. It shows the contents of this cache by using the ARP -A command. If any problems in communicating with one specific host, you can append the remote host's IP address to the ARP -

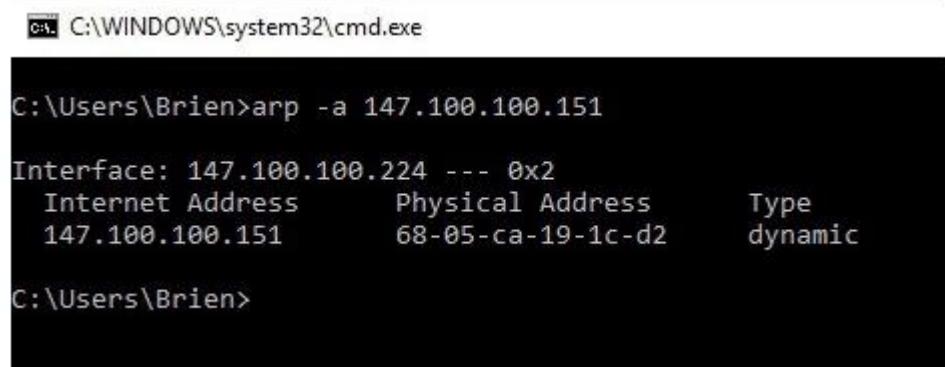

A command.

```
C:\Users\Codrut Neagu>arp -a

Interface: 192.168.50.239 --- 0x14
Internet Address      Physical Address      Type
192.168.50.1           04-d9-f5-b5-b1-f0    dynamic
192.168.50.4           90-94-97-c6-42-62    dynamic
192.168.50.60          ac-e4-b5-e0-5c-57    dynamic
192.168.50.96          00-28-f8-3c-eb-5a    dynamic
192.168.50.169         54-25-ea-a0-0a-51    dynamic
192.168.50.205         04-d9-f5-b5-dd-10    dynamic
192.168.50.247         b0-6e-bf-10-d1-62    dynamic
192.168.50.255         ff-ff-ff-ff-ff-ff    static
224.0.0.22              01-00-5e-00-00-16    static
224.0.0.251              01-00-5e-00-00-fb    static
224.0.0.252              01-00-5e-00-00-fc    static
239.255.255.250         01-00-5e-7f-ff-fa    static
255.255.255.255         ff-ff-ff-ff-ff-ff    static

C:\Users\Codrut Neagu>
```

```
C:\Windows\system32\cmd.exe

C:\Users\Brien>arp -a 147.100.100.151

Interface: 147.100.100.224 --- 0x2
Internet Address      Physical Address      Type
147.100.100.151        68-05-ca-19-1c-d2    dynamic

C:\Users\Brien>
```

## 7.NbtStat-n Command

The NbtStat -n command for example, shows the NetBIOS names that are in use by a device. The NbtStat -r command shows how many NetBIOS names the device has been able to resolve recently.

## 8.Route Command

IP networks use routing tables to direct packets from one subnet to another. The Windows Route utility allows you to view the device's routing tables. The Route command is that it not only shows you the routing table, it lets you make changes. Commands such as Route Add, Route Delete, and Route Change allow you to make routing table modifications on an as needed basis.

```
C:\ Command Prompt
C:\Users\Admin>route
Manipulates network routing tables.

ROUTE [-f] [-p] [-4|-6] command [destination]
      [MASK netmask] [gateway] [METRIC metric] [IF interface]

-f      Clears the routing tables of all gateway entries. If this is
       used in conjunction with one of the commands, the tables are
       cleared prior to running the command.

-p      When used with the ADD command, makes a route persistent across
       boots of the system. By default, routes are not preserved
       when the system is restarted. Ignored for all other commands,
       which always affect the appropriate persistent routes.

-4      Force using IPv4.

-6      Force using IPv6.

command      One of these:
```

## 9. GETMAC Command

Getmac is a Windows command used to display the Media Access Control (MAC) addresses for each network adapter in the computer. One of the fastest and easiest ways to obtain the MAC addresses of your network adapters is to use the getmac command. In Command Prompt, type getmac and press Enter, as seen in the image below.

```
C:\ Command Prompt
C:\Users\Codrut Neagu>getmac

Physical Address      Transport Name
-----
04-D9-F5-34-B1-A3    \Device\Tcpip_{94EBAE5D-9C8B-40A3-90CF-7D806D1D0F4D}
04-D9-F5-34-B1-A2    Media disconnected
38-00-25-41-C3-F5    Media disconnected
00-50-56-C0-00-01    \Device\Tcpip_{1B88E222-B53F-42AF-9029-79400A0F750F}
00-50-56-C0-00-08    \Device\Tcpip_{7F80AD46-E70A-4A38-877E-02763783EB92}

C:\Users\Codrut Neagu>
```

## 10. SYSTEMINFO Command: System Information

If you need to know what brand of network card you have, processor details, or the exact version of your Windows OS, the SYSTEMINFO command can help. This command polls your system

and pulls the most important information about your system. It lists the information in a clean format that's easy to read.

## **Module-2**

### **Cisco Packet Tracer tool**

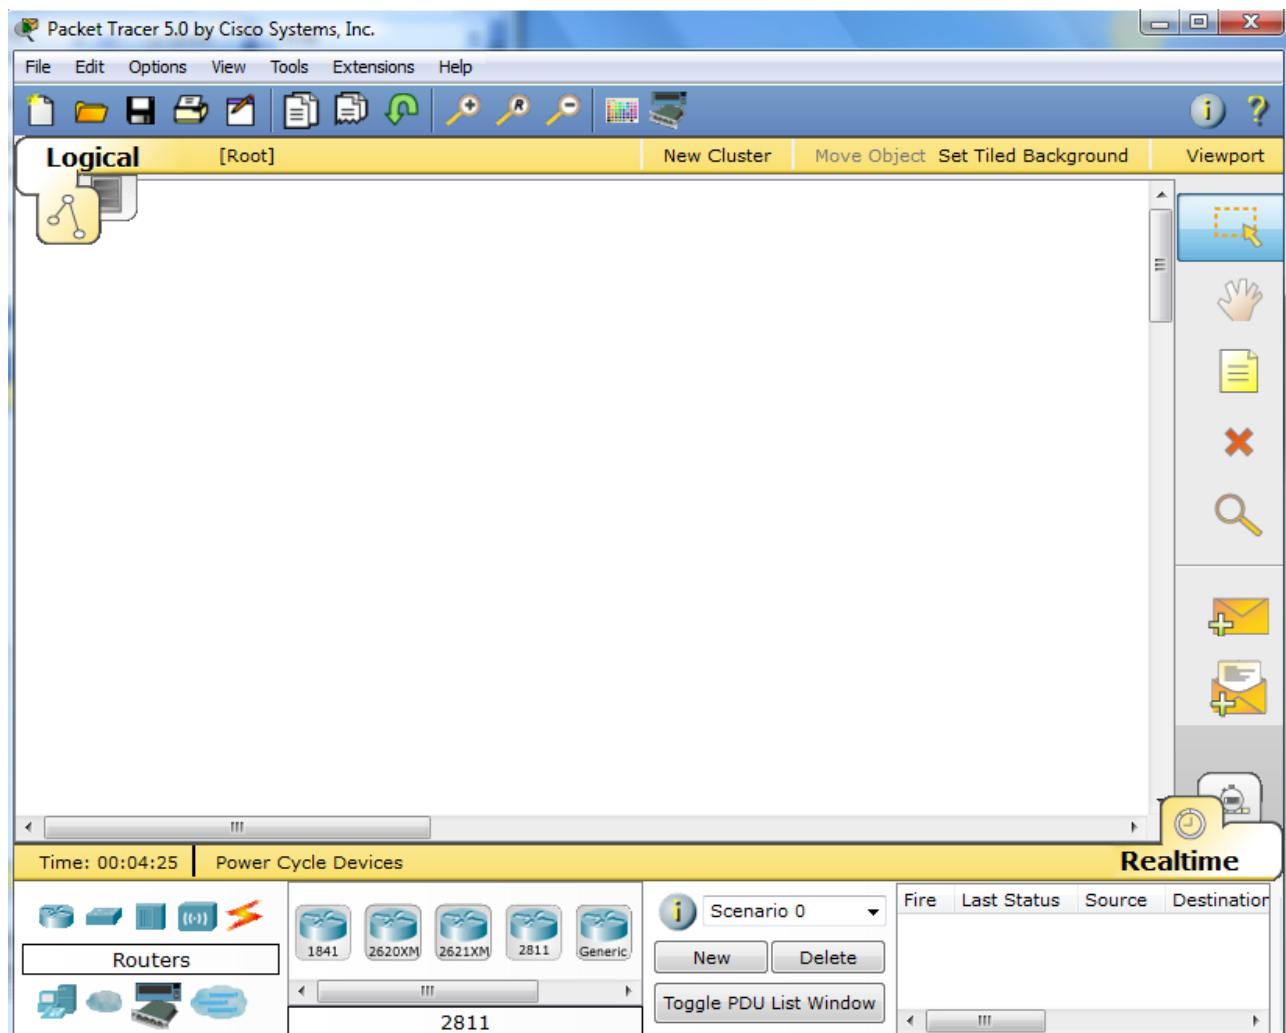

#### **Packet Tracer – Creating a New Topology**

**What is Packet Tracer?** Packet Tracer is a protocol simulator developed by Dennis Frezzo and his team at Cisco Systems. Packet Tracer (PT) is a powerful and dynamic tool that displays the various protocols used in networking, in either Real Time or Simulation mode. This includes layer 2 protocols such as Ethernet and PPP, layer 3 protocols such as IP, ICMP, and ARP, and layer 4 protocols such as TCP and UDP. Routing protocols can also be traced.

**Purpose:** The purpose of this lab is to become familiar with building topologies in Packet Tracer.

**Version:** This lab is based on Packet Tracer 5.0, 7.3.0

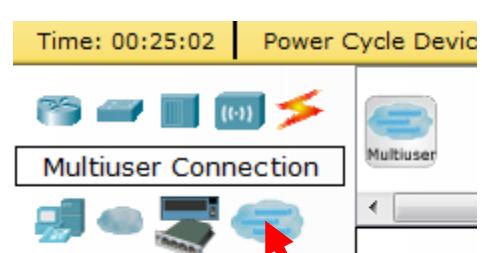

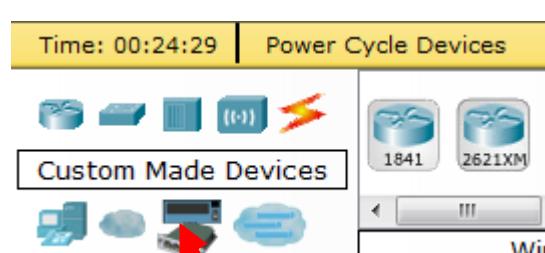

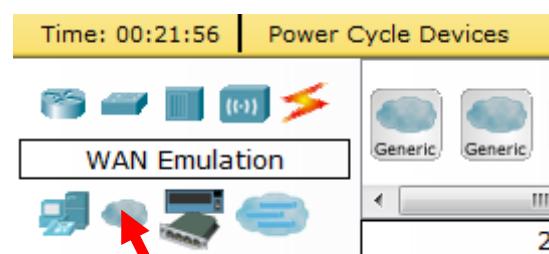

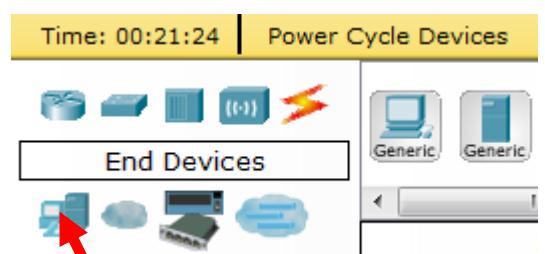

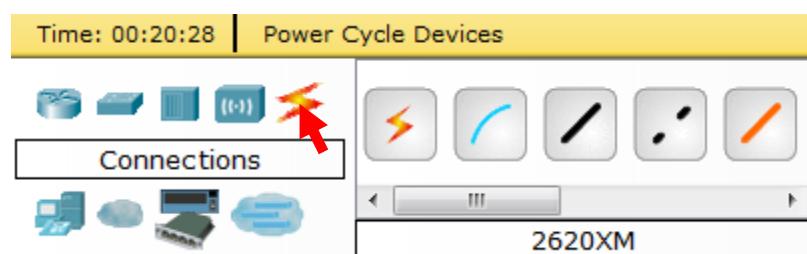

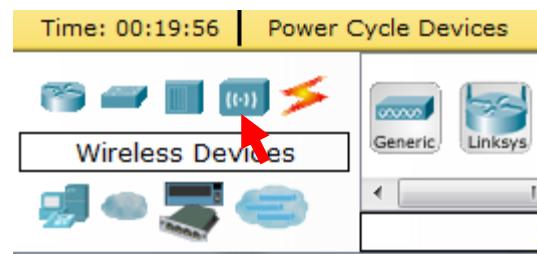

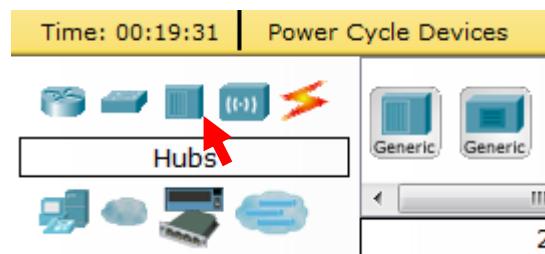

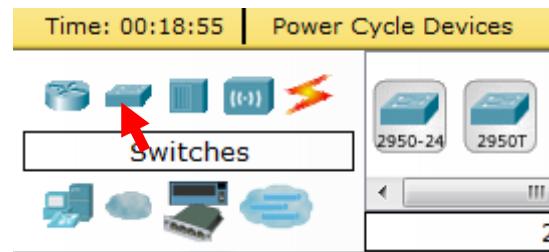

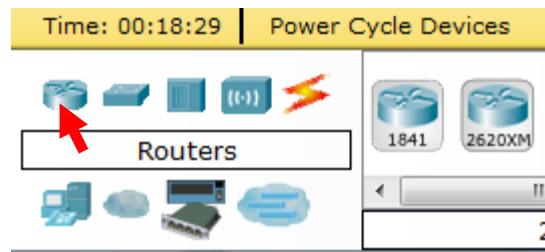

#### **Step 1: Start Packet Tracer**

## Step 2: Choosing Devices and Connections

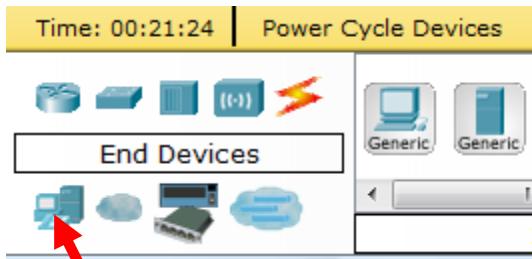

We will begin building our network topology by selecting devices and the media in which to connect them. Several types of devices and network connections can be used. For this lab we will keep it simple by using **End Devices**, **Switches**, **Hubs**, and **Connections**.

Single click on each group of devices and connections to display the various choices. The devices you see may differ slightly.

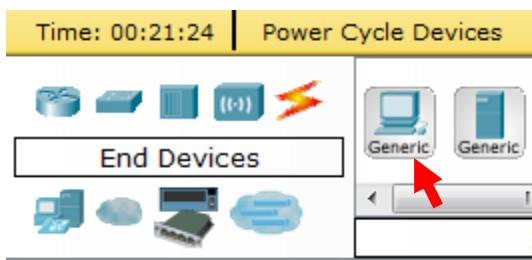

### Step 3: Building the Topology – Adding Hosts

Single click on the **End Devices**.

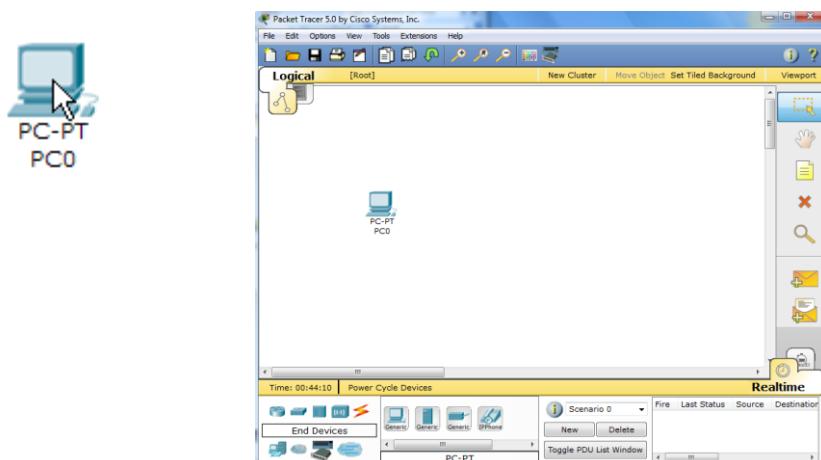

Single click on the **Generic host**.

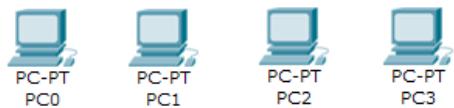

Move the cursor into topology area. You will notice it turns into a plus “+” sign.

Single click in the topology area and it copies the device.

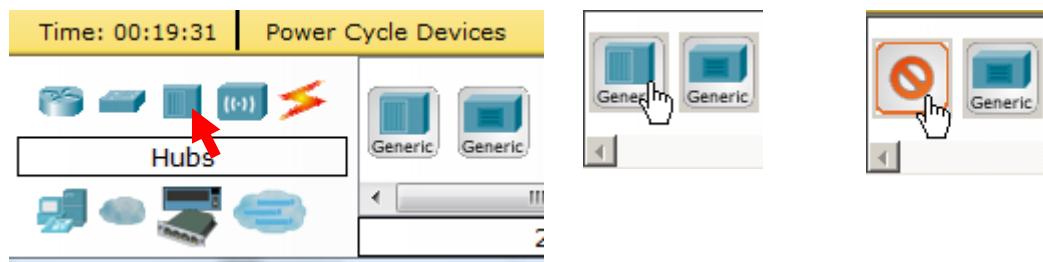

Add three more hosts.

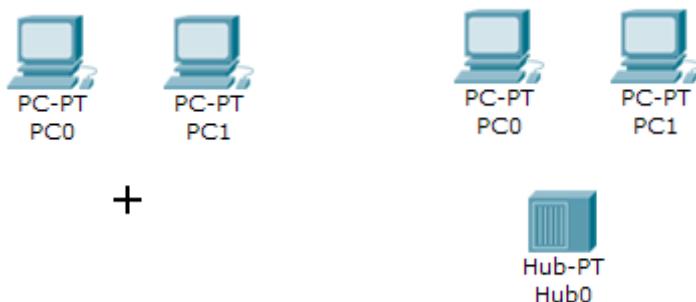

## Step 4: Building the Topology – Connecting the Hosts to Hubs and Switches

### Adding a Hub

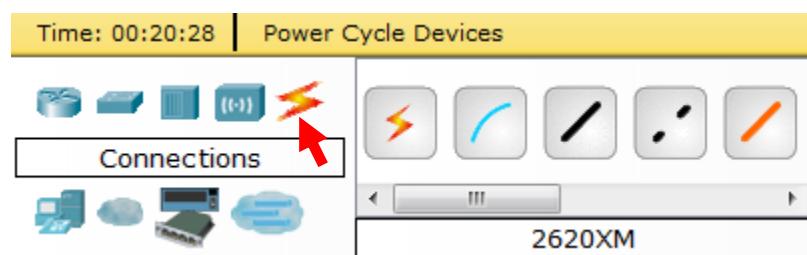

Select a hub, by clicking once on **Hubs** and once on a **Generic** hub.

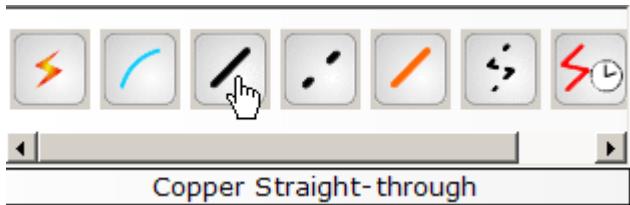

Add the hub by moving the plus sign “+” below PC0 and PC1 and click once.

Connect PC0 to Hub0 by first choosing **Connections**.

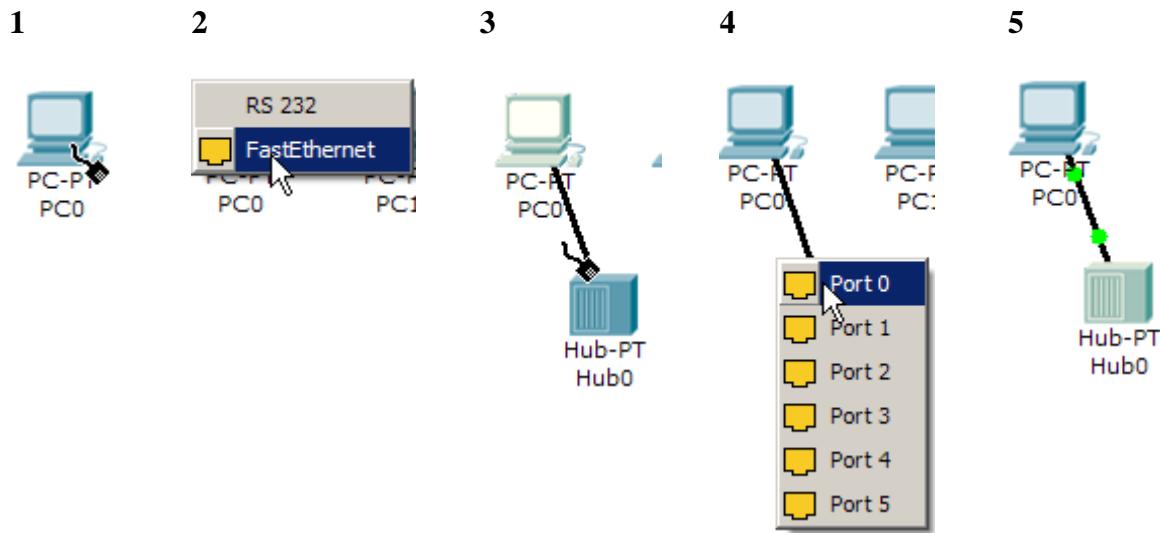

Click once on the **Copper Straight-through** cable.

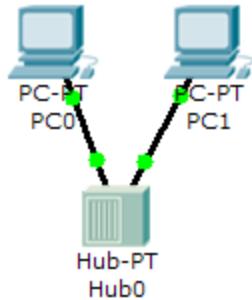

Perform the following steps to connect **PC0** to **Hub0**:

1. Click once on **PC0**
2. Choose **FastEthernet**
3. Drag the cursor to **Hub0**
4. Click once on **Hub0** and choose **Port 0**
5. Notice the green link lights on both the **PC0** Ethernet NIC and the **Hub0** Port 0 showing that the link is active.

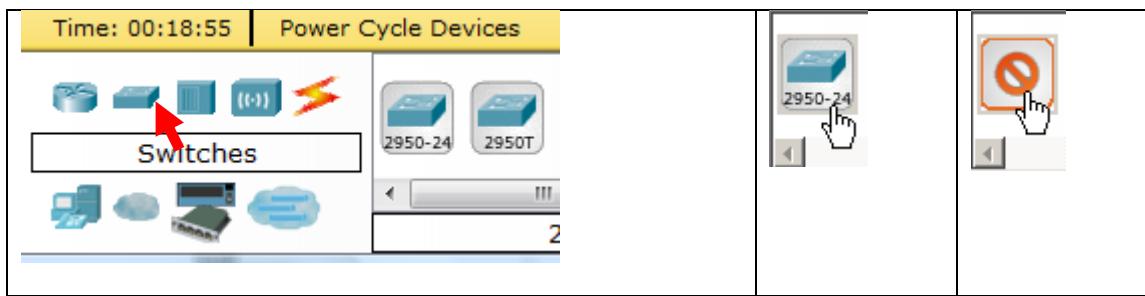

Repeat the steps above for **PC1** connecting it to **Port 1** on **Hub0**. (The actual hub port you choose does not matter.)

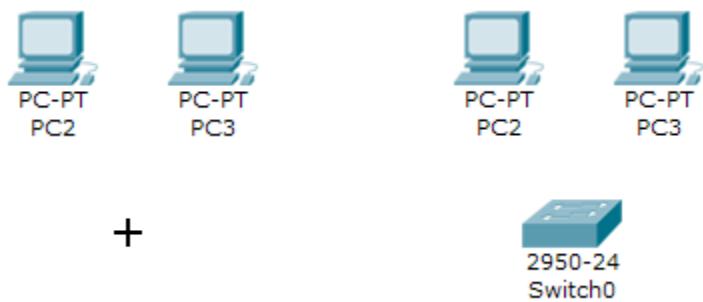

### **Adding a Switch**

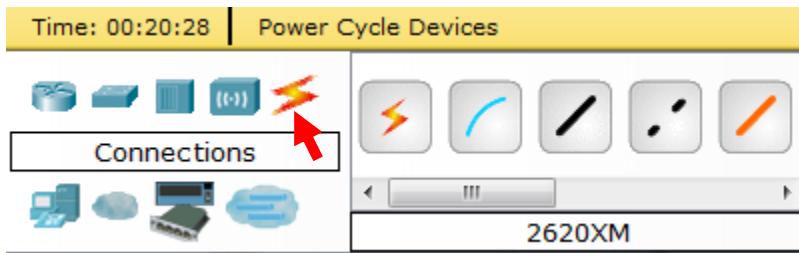

Select a switch, by clicking once on **Switches** and once on a **2950-24** switch.

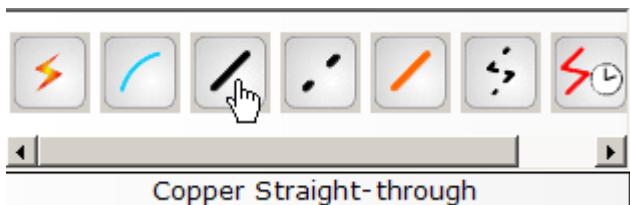

Add the switch by moving the plus sign “+” below PC2 and PC3 and click once.

Connect PC2 to Hub0 by first choosing **Connections**.

Click once on the **Copper Straight-through** cable.

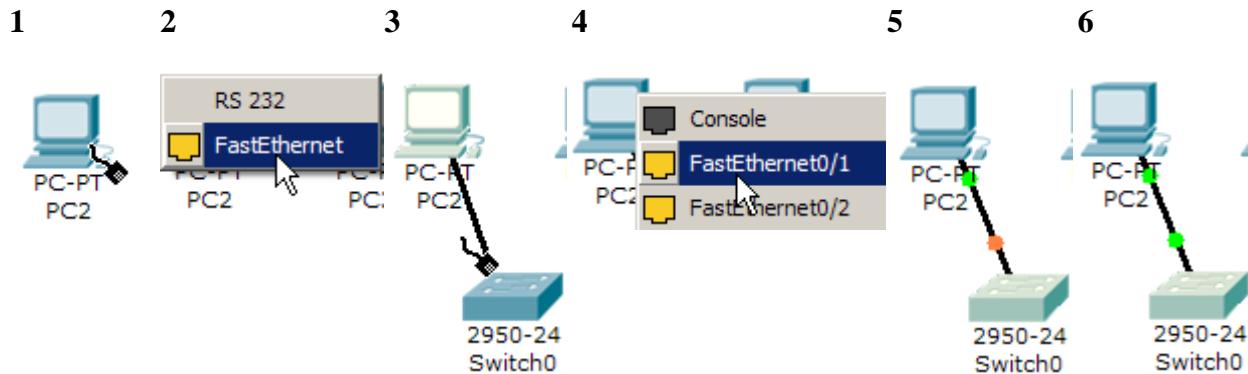

Perform the following steps to connect **PC2** to **Switch0**:

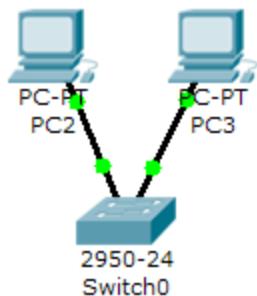

1. Click once on **PC2**
2. Choose **FastEthernet**
3. Drag the cursor to **Switch0**
4. Click once on **Switch0** and choose **FastEthernet0/1**

5. Notice the green link lights on **PC2** Ethernet NIC and amber light **Switch0 FastEthernet0/1 port**. The switch port is temporarily not forwarding frames, while it goes through the stages for the Spanning Tree Protocol (STP) process.
6. After about 30 seconds the amber light will change to green indicating that the port has entered the forwarding stage. Frames can now be forwarded out the switch port.

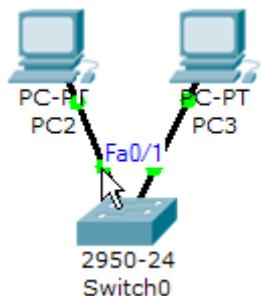

Note: Spanning Tree Protocol (STP) is discussed later.

Repeat the steps above for **PC3** connecting it to **Port 3** on **Switch0** on port **FastEthernet0/2**. (The actual switch port you choose does not matter.)

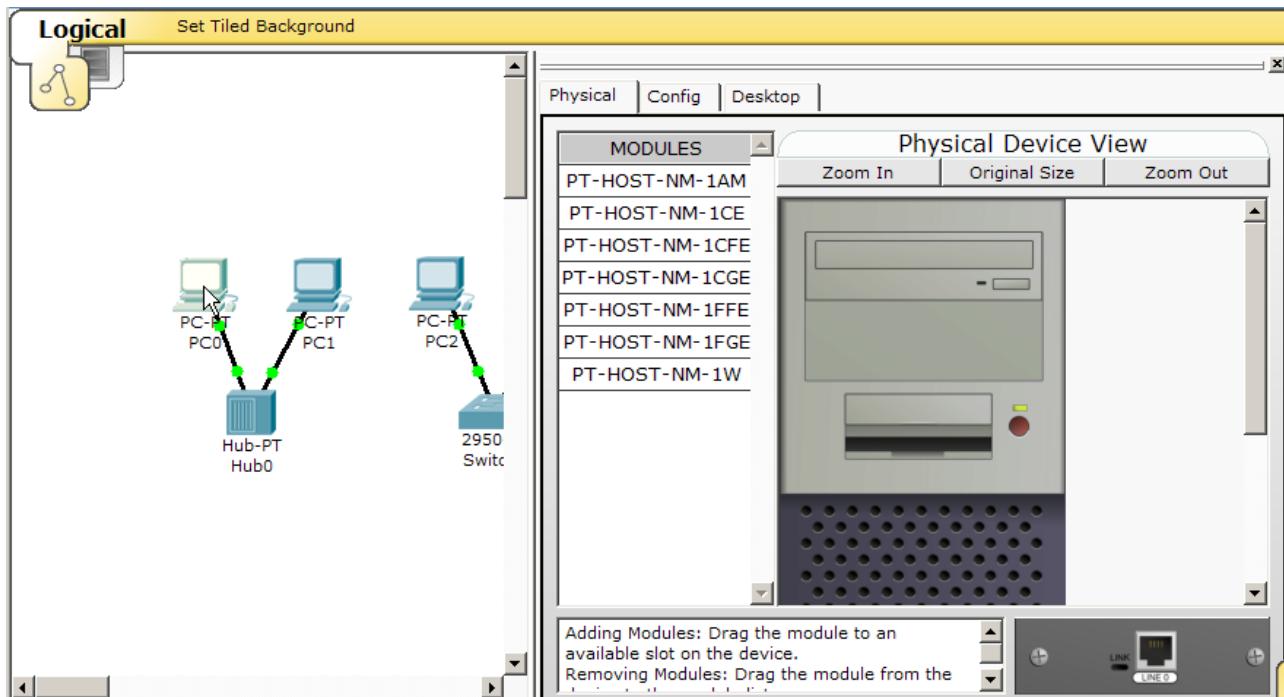

Move the cursor over the link light to view the port number. **Fa** means FastEthernet, 100 Mbps Ethernet.

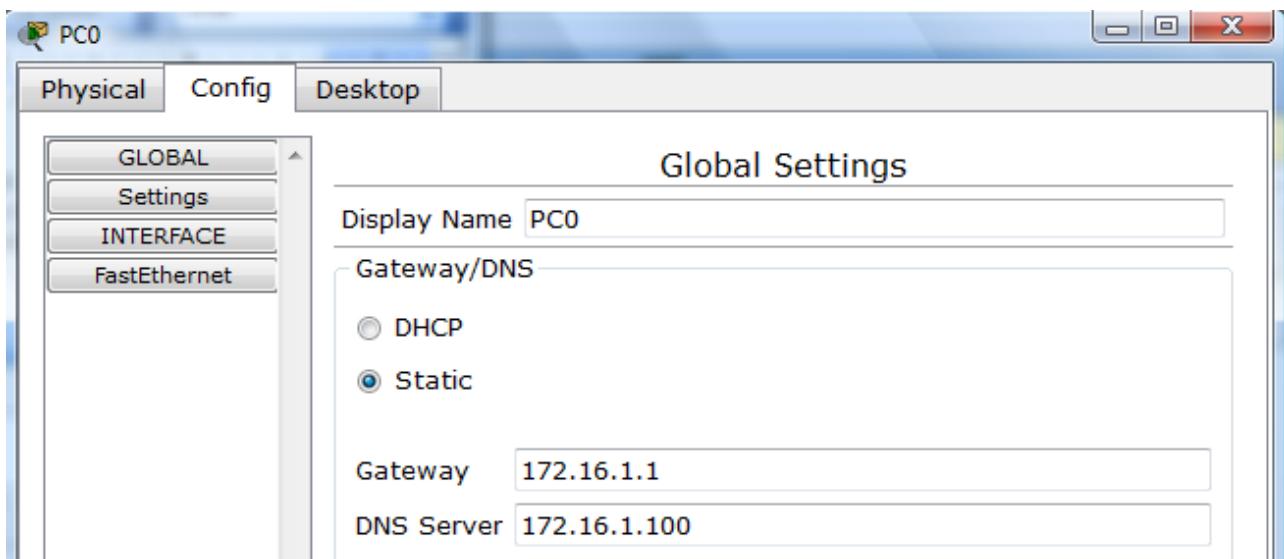

## Step 5: Configuring IP Addresses and Subnet Masks on the Hosts

Before we can communicate between the hosts we need to configure IP Addresses and Subnet Masks on the devices.

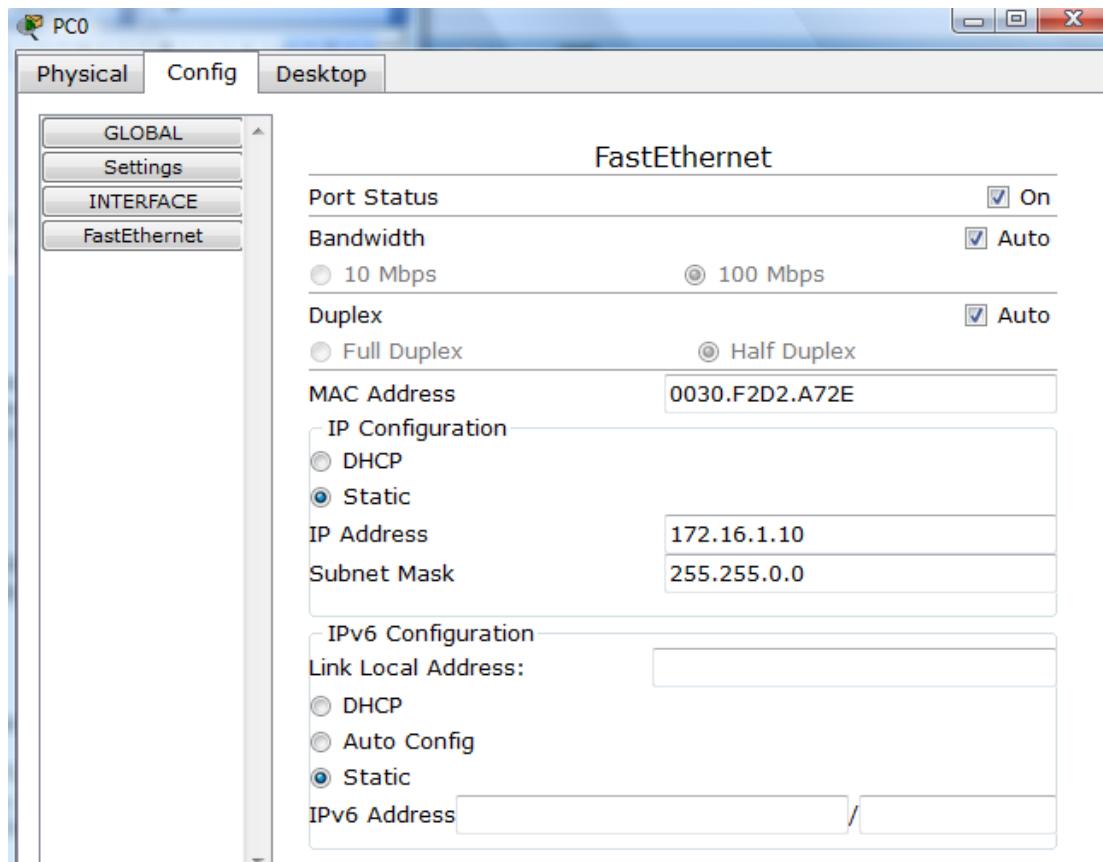

Click once on PC0.

Choose the **Config** tab and click on **Settings**. It is here that you can change the name of PC0. It is also here where you would enter a **Gateway** IP Address, also known as the default gateway and the **DNS Server** IP Address. We will discuss this later, but this would be the IP address of the local router. If you want, you can enter the Gateway IP Address 172.16.1.1 and DNS Server IP Address 172.16.1.100, although it will not be used in this lab.

Click on **Interface** and then **FastEthernet**. Although we have not yet discussed IP Addresses, add the IP Address to 172.16.1.10. Click once in the Subnet Mask field to enter the default Subnet Mask. You can leave this at 255.255.0.0. We will discuss this later.

Also, notice this is where you can change the Bandwidth (speed) and Duplex of the Ethernet NIC (Network Interface Card). The default is Auto (autonegotiation), which means the NIC will negotiate with the hub or switch. The bandwidth and/or duplex can be manually set by removing the check from the **Auto** box and choosing the specific option.

### **Bandwidth - Auto**

If the host is connected to a hub or switch port which can do 100 Mbps, then the Ethernet NIC on the host will choose 100 Mbps (Fast Ethernet). Otherwise, if the hub or switch port can only do 10 Mbps, then the Ethernet NIC on the host will choose 10 Mbps (Ethernet).

### **Duplex - Auto**

**Hub:** If the host is connected to a hub, then the Ethernet NIC on the host will choose Half Duplex.

**Switch:** If the host is connected to a switch, and the switch port is configured as Full Duplex (or Autonegotiation), then the Ethernet NIC on the host will choose Full Duplex. If the switch port is

configured as Half Duplex, then the Ethernet NIC on the host will choose Half Duplex. (Full Duplex is a much more efficient option.)

The information is automatically saved when entered.

To close this dialog box, click the “X” in the upper right.

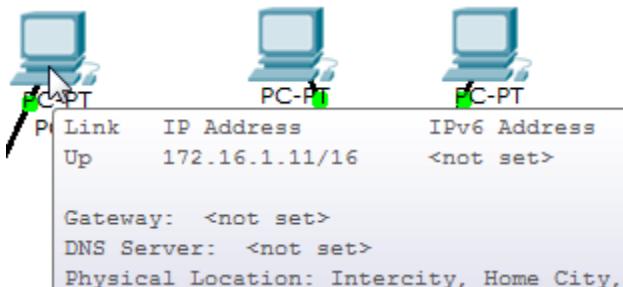

Repeat these steps for the other hosts. Use the information below for IP Addresses and Subnet Masks.

<u>Host</u>	<u>IP Address</u>	<u>Subnet Mask</u>
PC0	172.16.1.10	255.255.0.0
PC1	172.16.1.11	255.255.0.0
PC2	172.16.1.12	255.255.0.0
PC3	172.16.1.13	255.255.0.0

### Verify the information

To verify the information that you entered, move the Select tool (arrow) over each host.

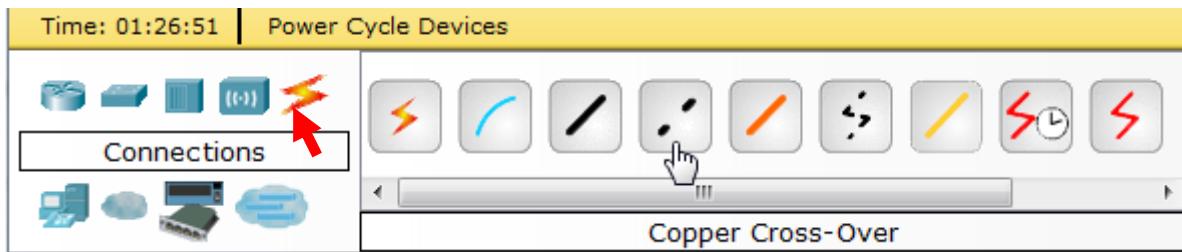

### Deleting a Device or Link

To delete a device or link, choose the **Delete** tool and click on the item you wish to delete.

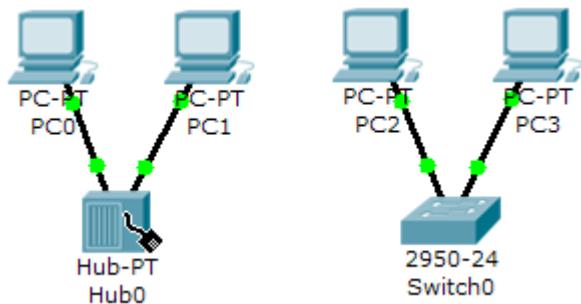

### Step 6: Connecting Hub0 to Switch0

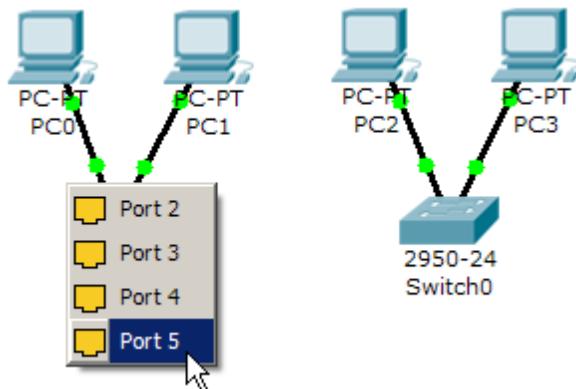

To connect like-devices, like a Hub and a Switch, we will use a Cross-over cable. Click once the **Cross-over** Cable from the **Connections** options.

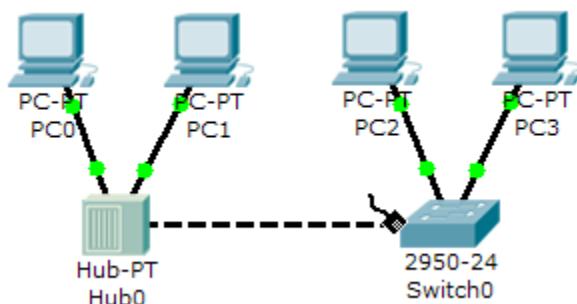

Move the Connections cursor over **Hub0** and click once.

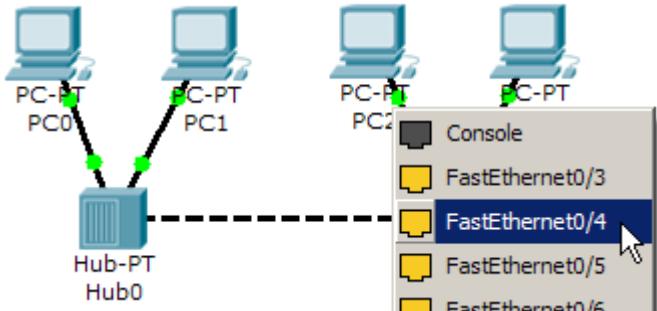

Select **Port 5** (actual port does not matter).

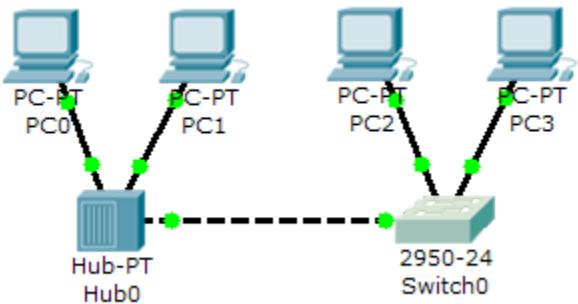

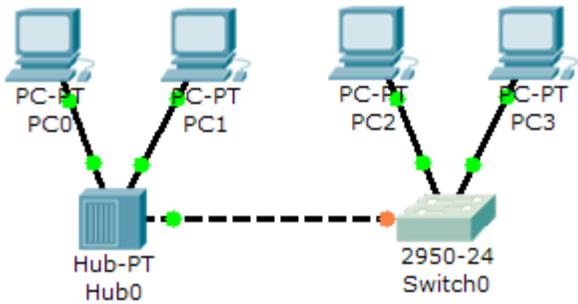

Move the Connections cursor to **Switch0**.

Click once on **Switch0** and choose **FastEthernet0/4** (actual port does not matter).

The link light for switch port **FastEthernet0/4** will begin as amber and eventually change to green as the Spanning Tree Protocol transitions the port to forwarding.

### Step 7: Verifying Connectivity in Realtime Mode

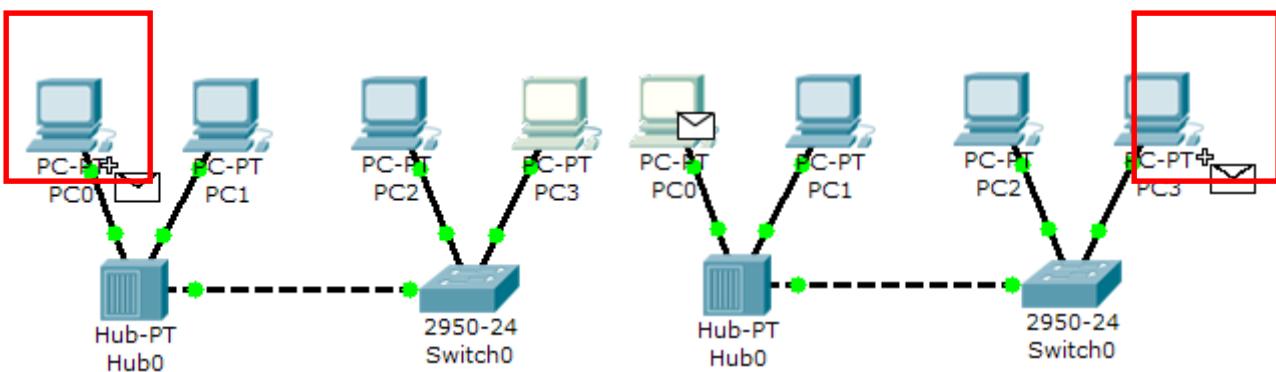

Be sure you are in **Realtime** mode.

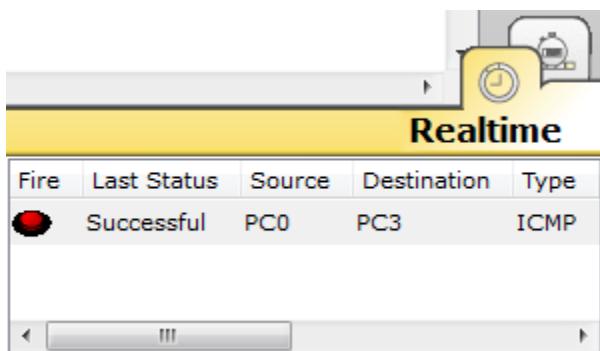

Select the **Add Simple PDU** tool used to ping devices..

Click once on PC0, then once on PC3.

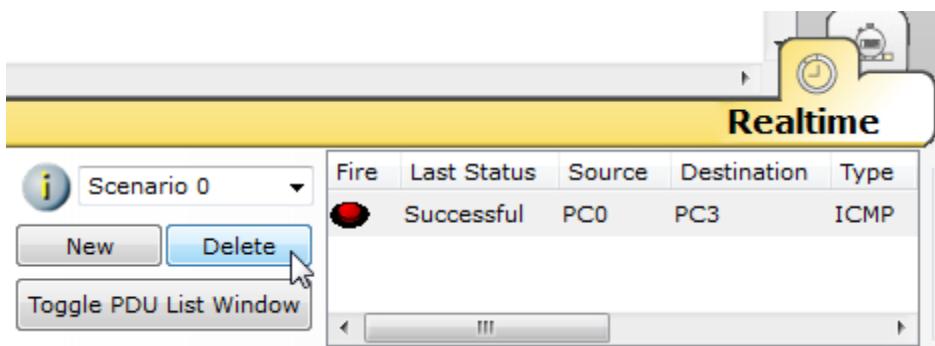

The PDU Last Status should show as **Successful**.

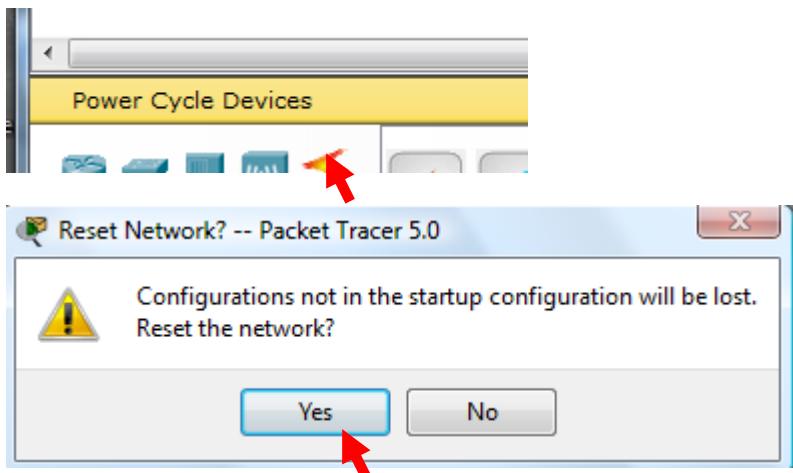

### Resetting the Network

At this point we will want to reset the network. Whenever you want to reset the network and begin the simulation again, perform the following tasks:

Click **Delete** in the PDU area.

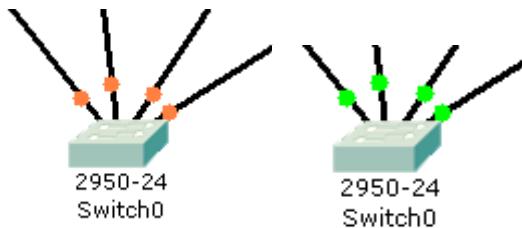

Now, Power Cycle Devices and confirm the action.

### Waiting for Spanning Tree Protocol (STP)

**Note:** Because Packet Tracer also simulates the Spanning Tree Protocol (later), at times the switch may show amber lights on its interfaces. You will need to wait for the lights to turn green on the switches before they will forward any Ethernet frames.

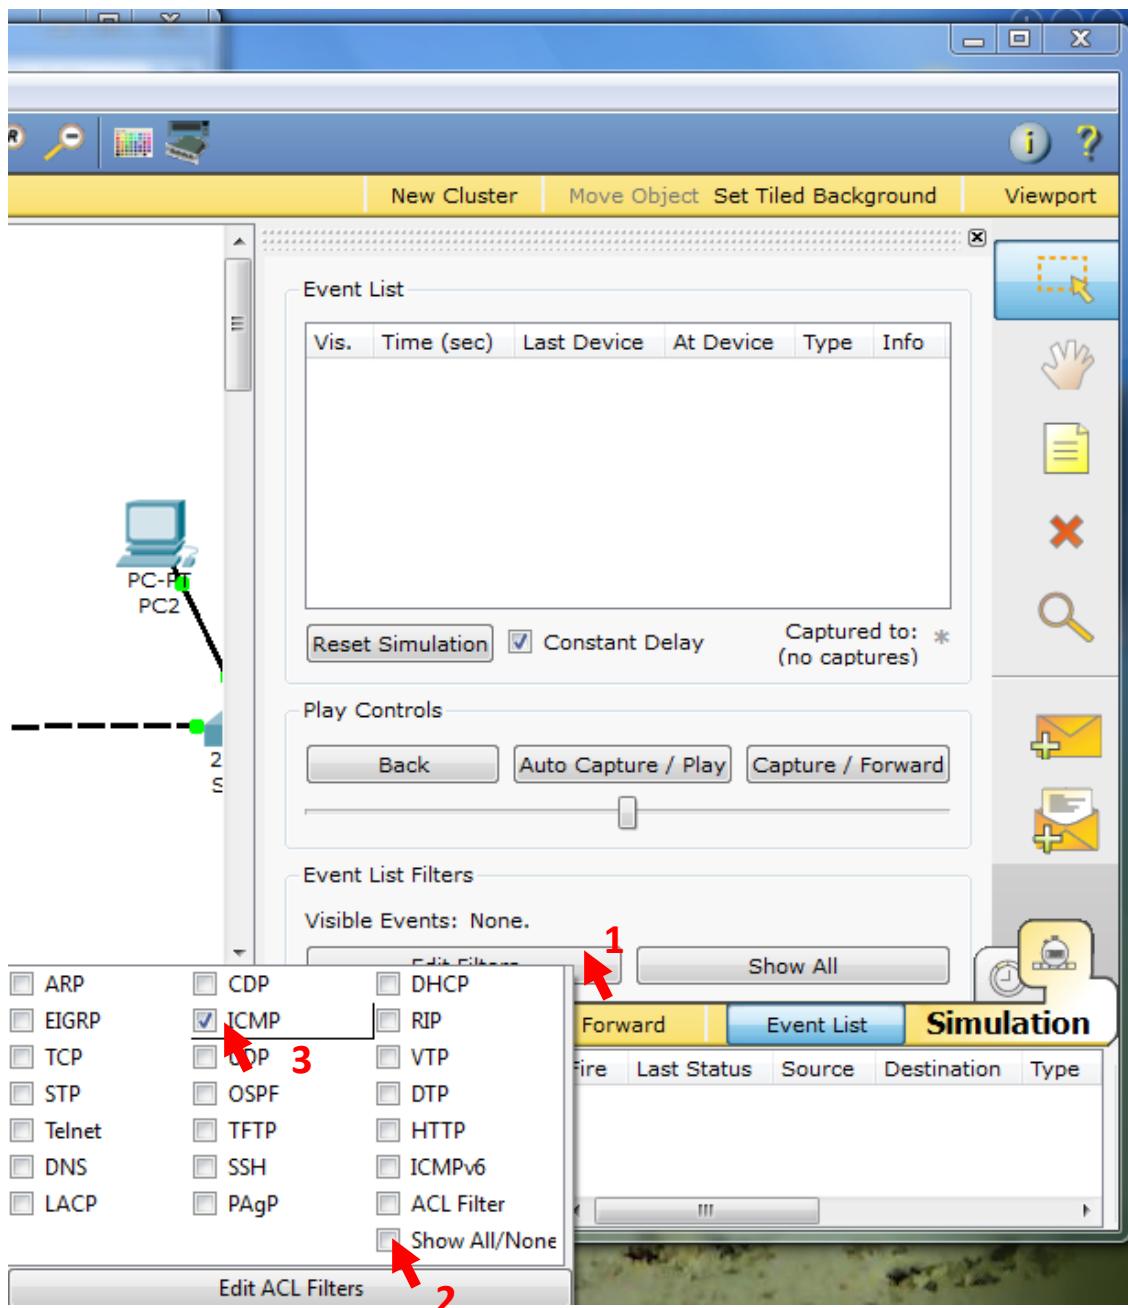

### Step 8: Verifying Connectivity in Simulation Mode

Be sure you are in **Simulation** mode.

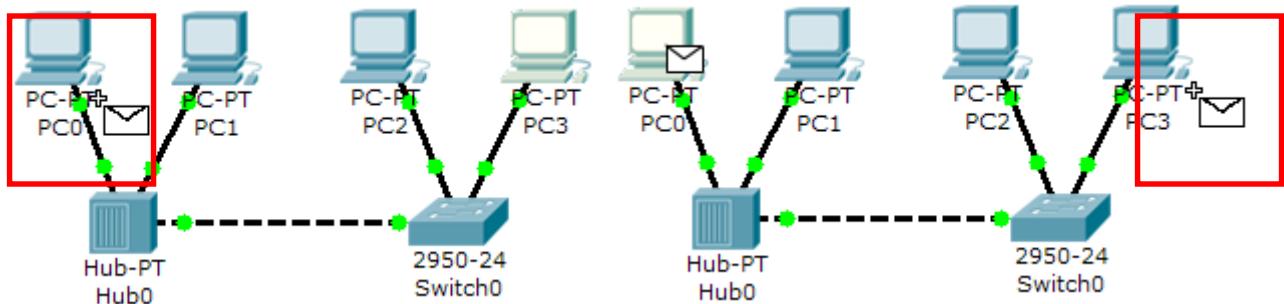

Deselect all filters (All/None) and select only **ICMP**.

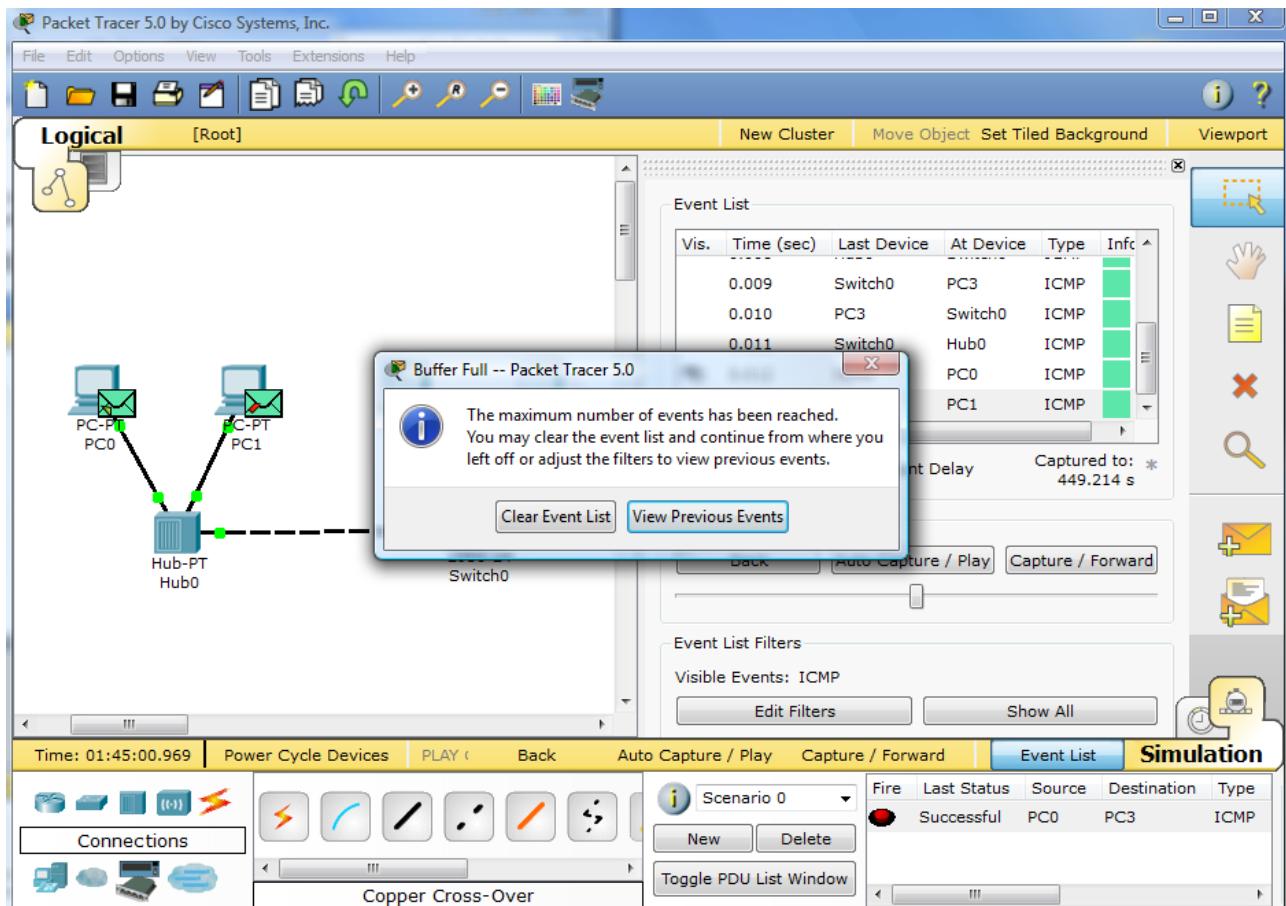

Select the Add Simple PDU tool used to ping devices..

Click once on PC0, then once on PC3.

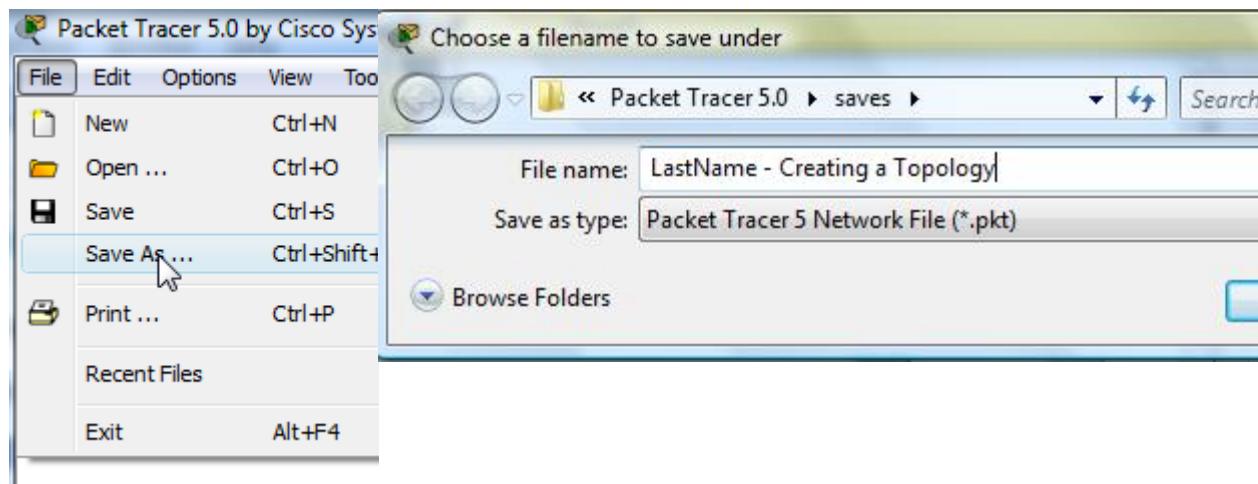

Continue clicking **Capture/Forward** button until the ICMP ping is completed. You should see the ICMP messages move between the hosts, hub and switch. The PDU **Last Status** should show as **Successful**. Click on **Clear Event List** if you do not want to look at the events or click **Preview Previous Events** if you do. For this exercise it does not matter.

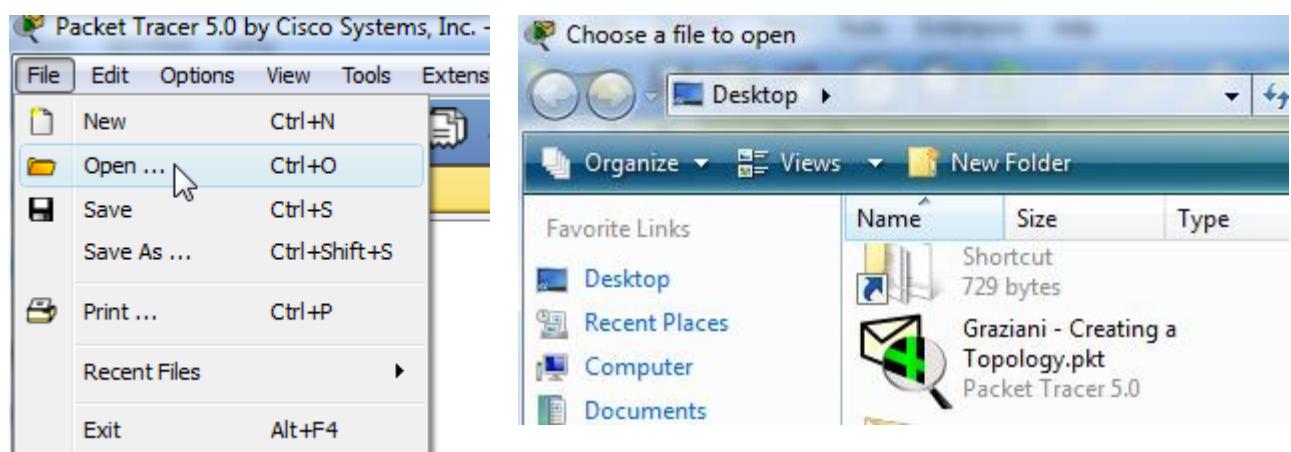

### Step 9: Saving the Topology

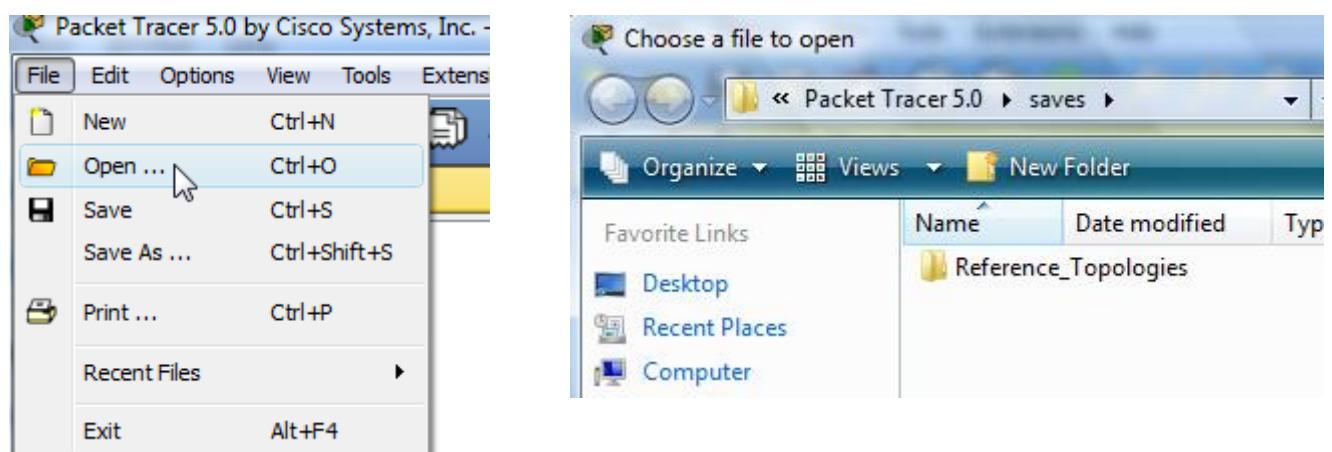

Perform the following steps to save the topology (uses .pkt file extension).

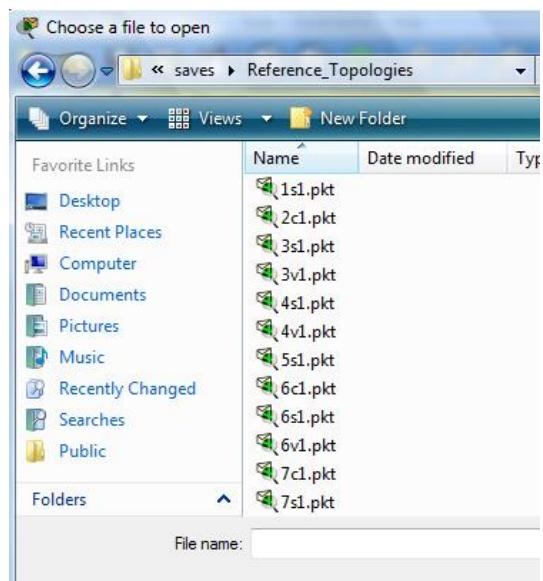

## Opening Existing Topologies

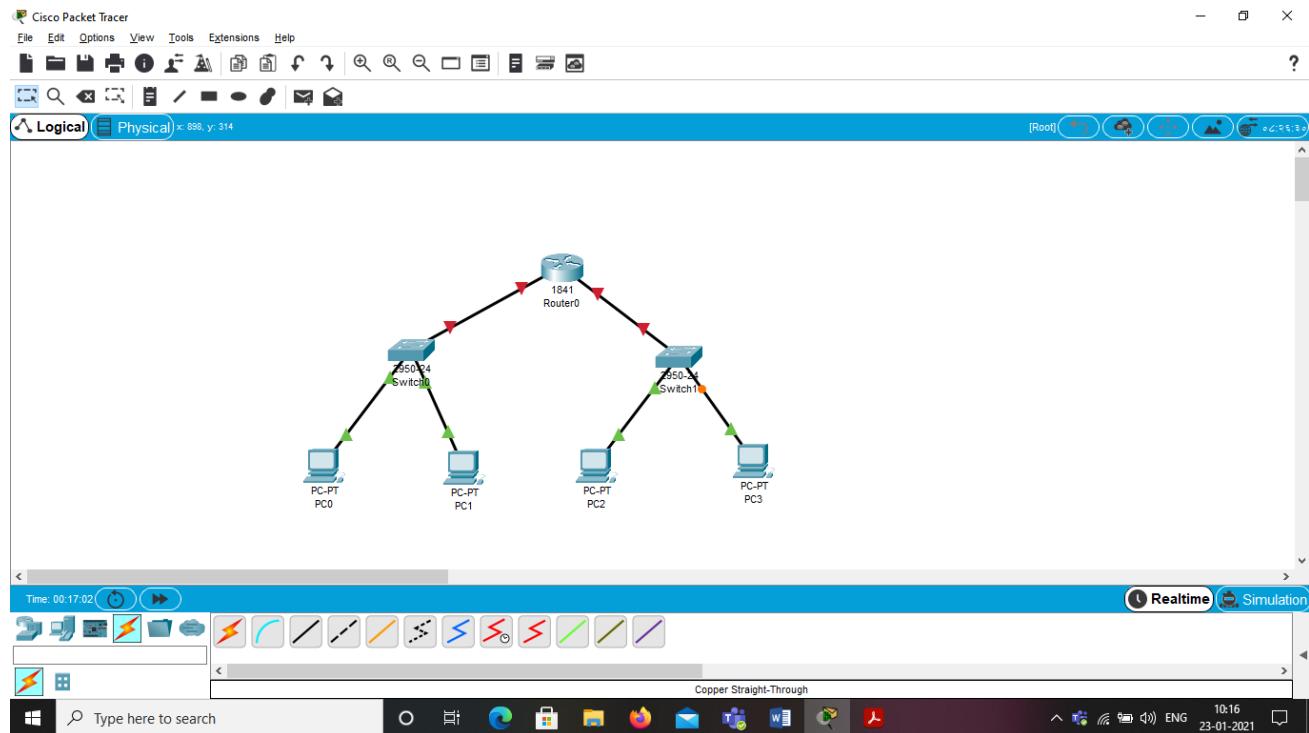

## Opening Existing PT Topologies

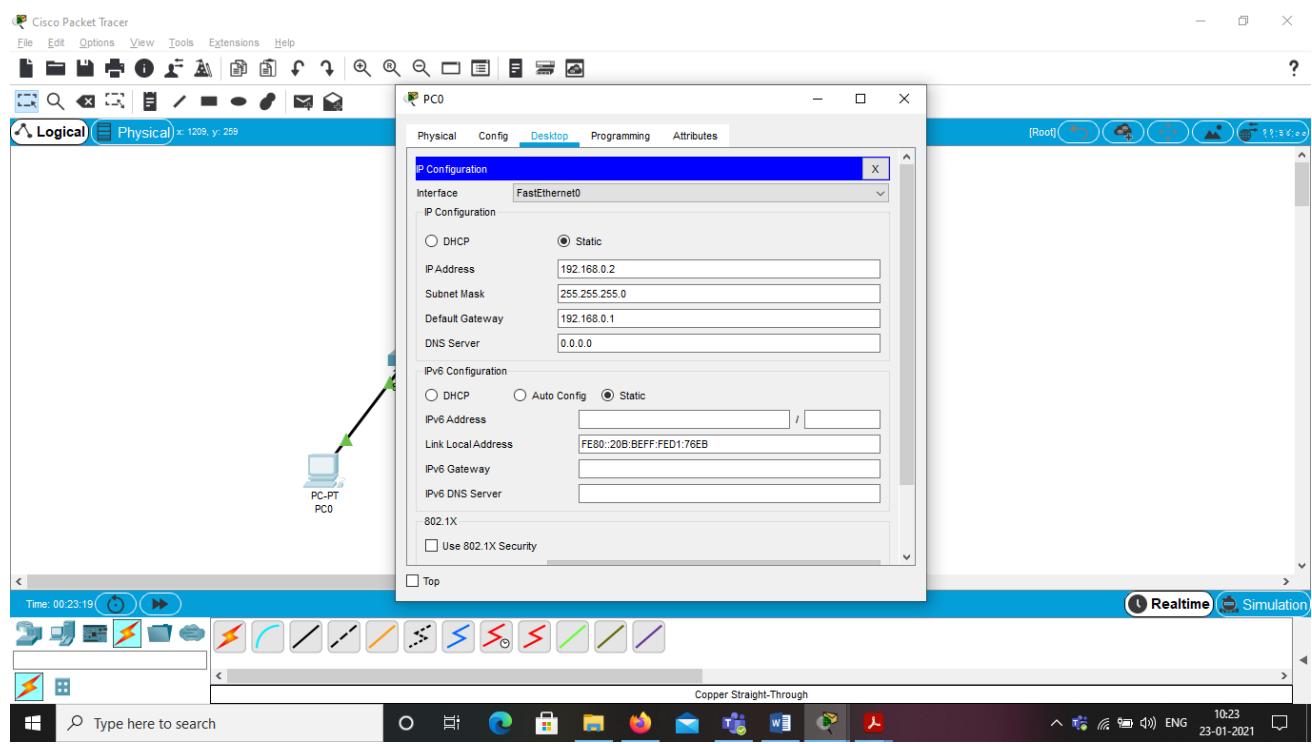

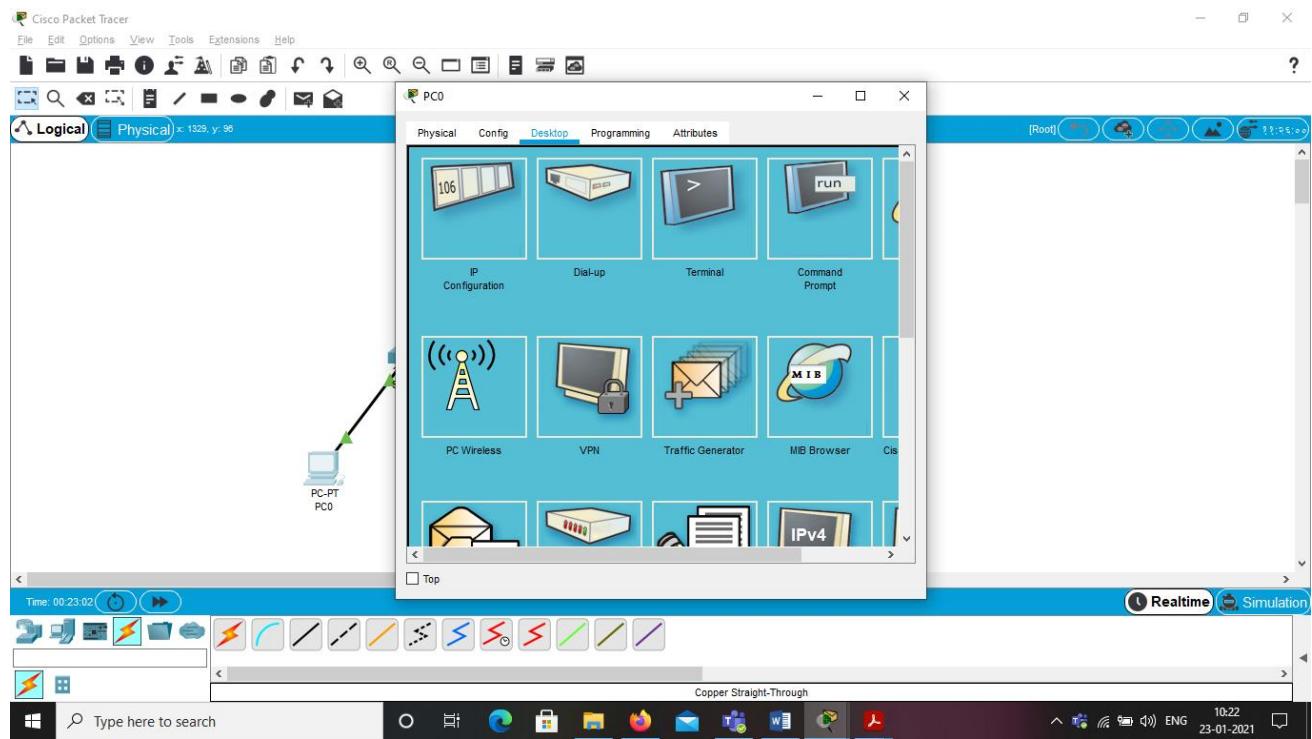

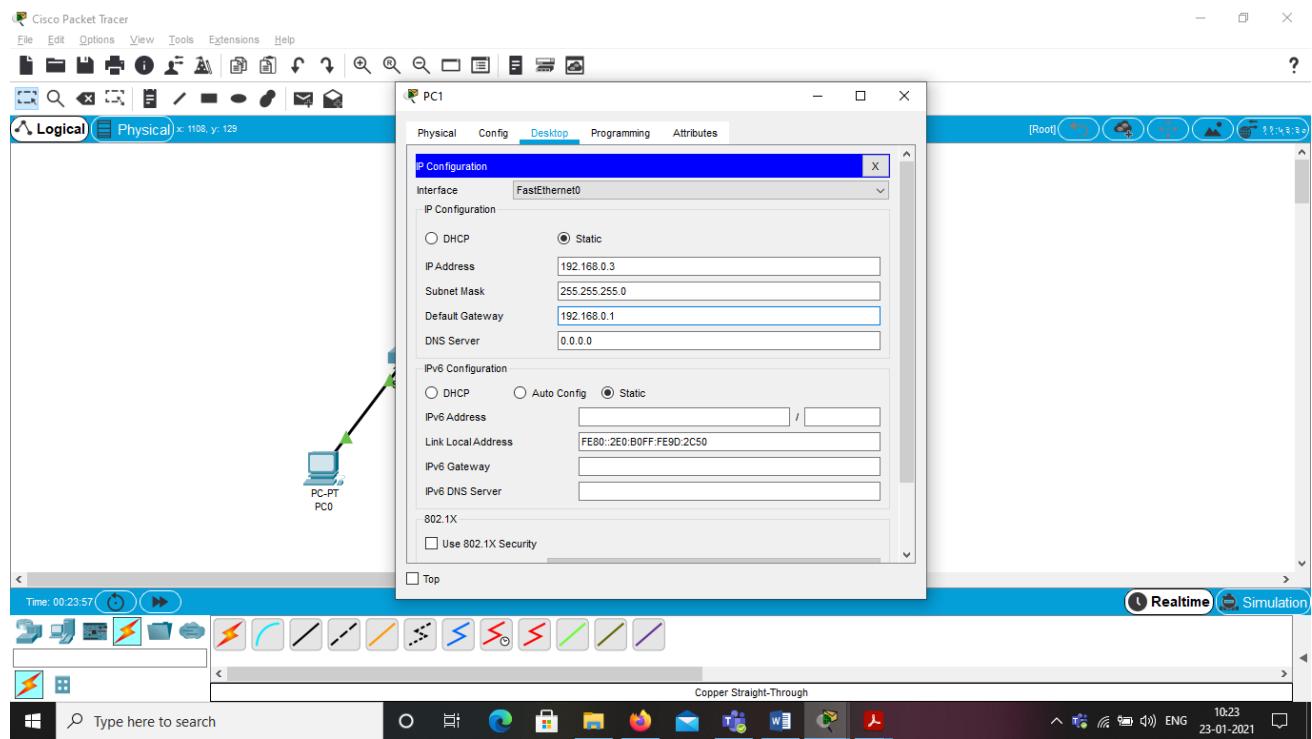

## Exp 1: Configuration of Router using cisco packet tracer

### Step 1: Construct the topology

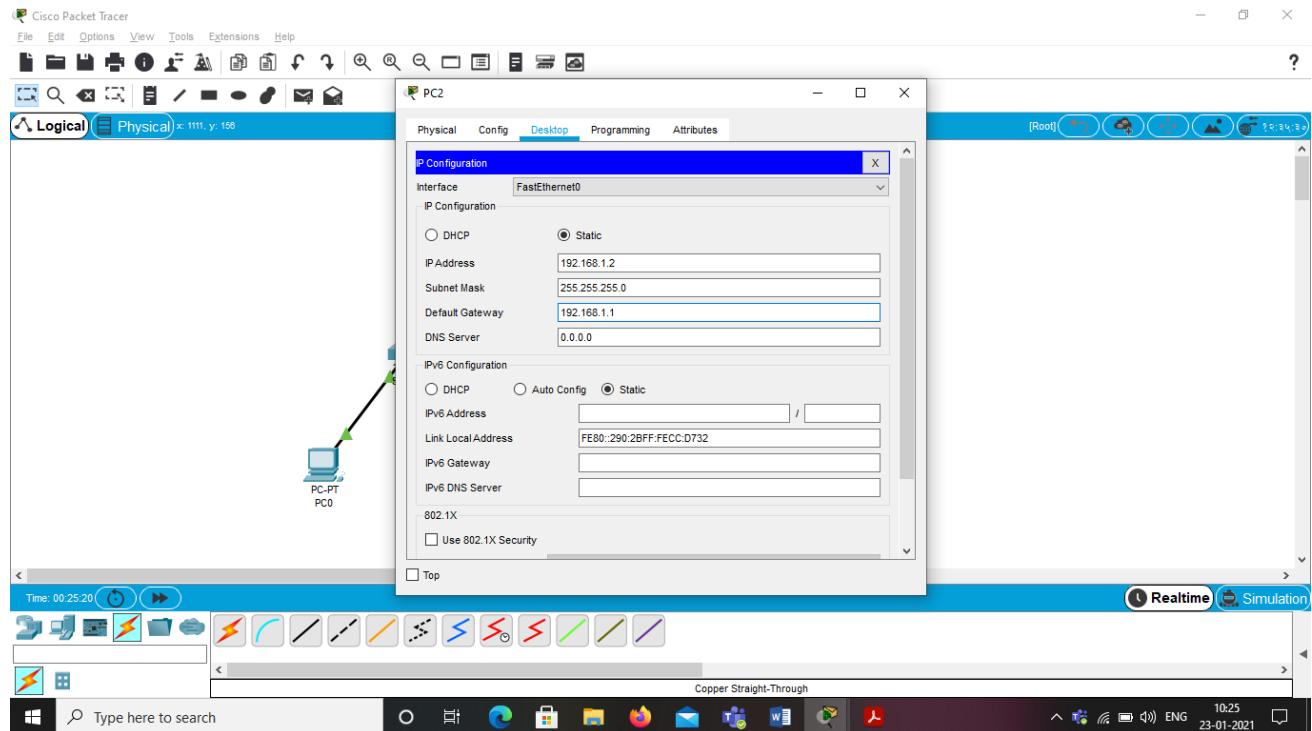

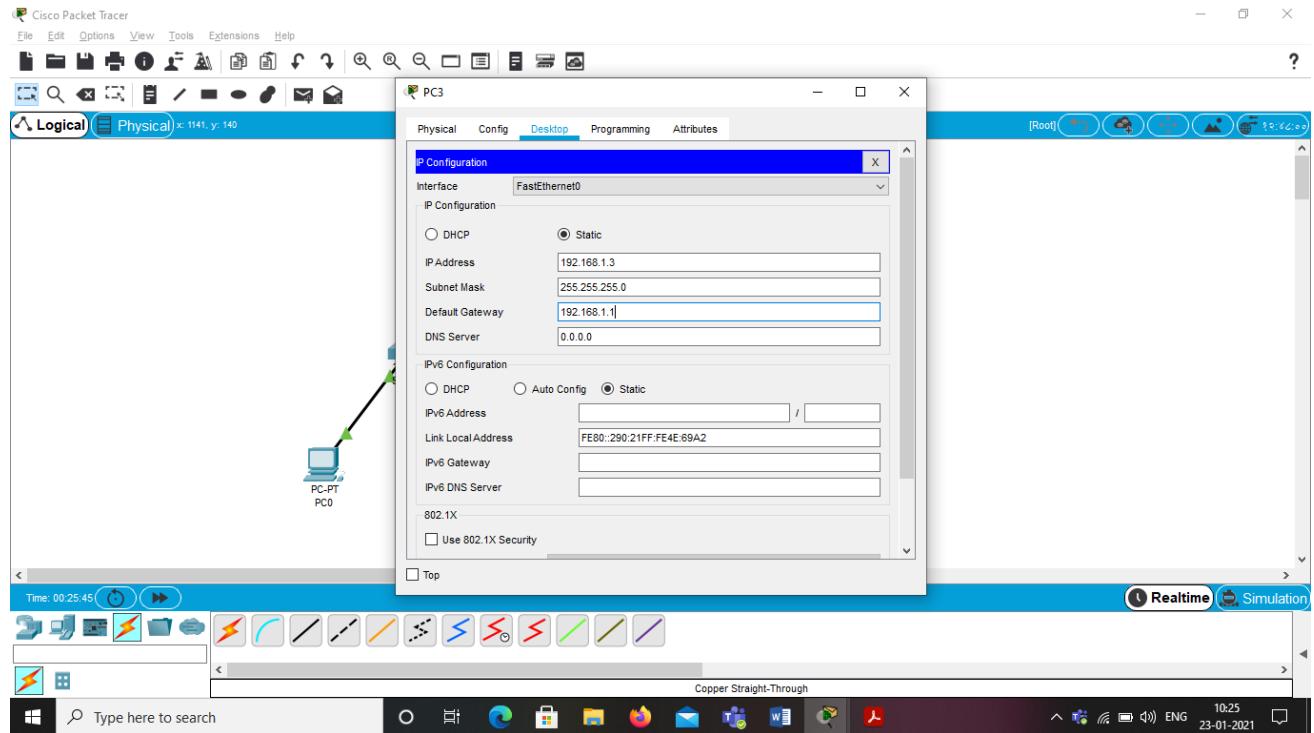

### Step 2: Assign IP addresses to all PC's.

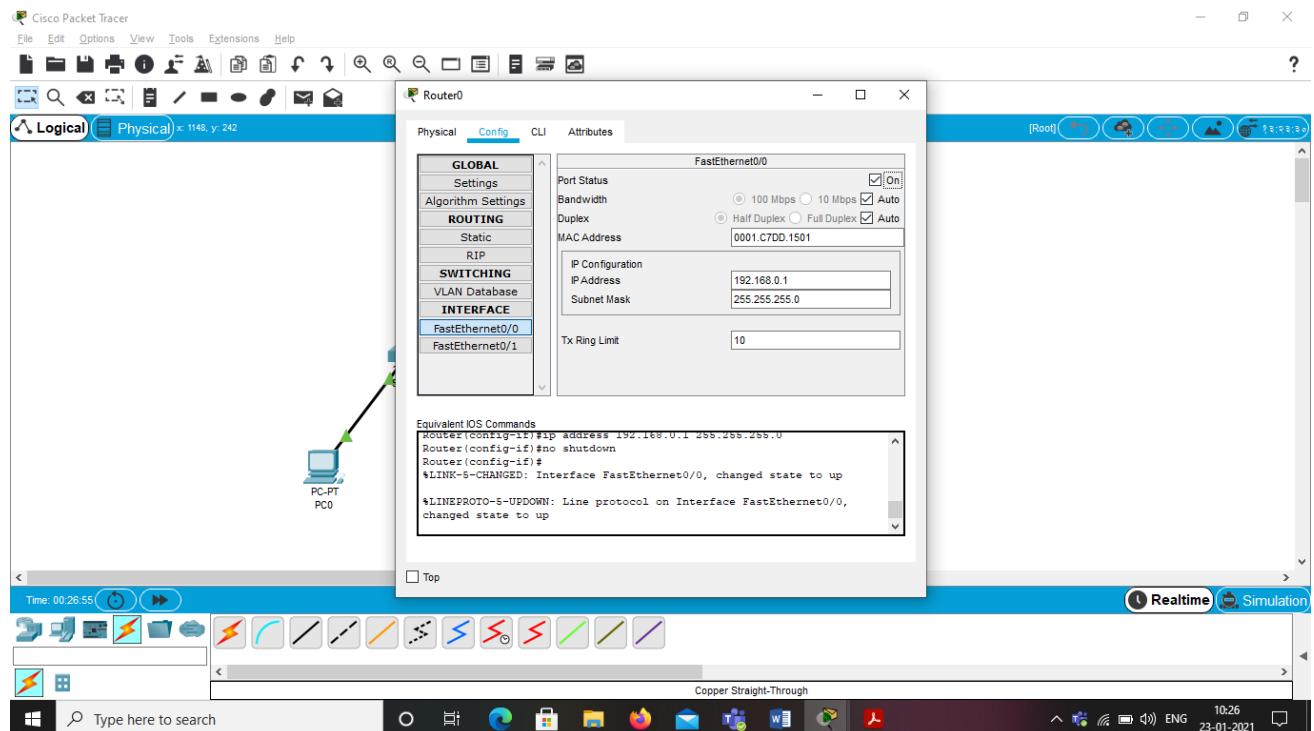

Use another network address for second network.

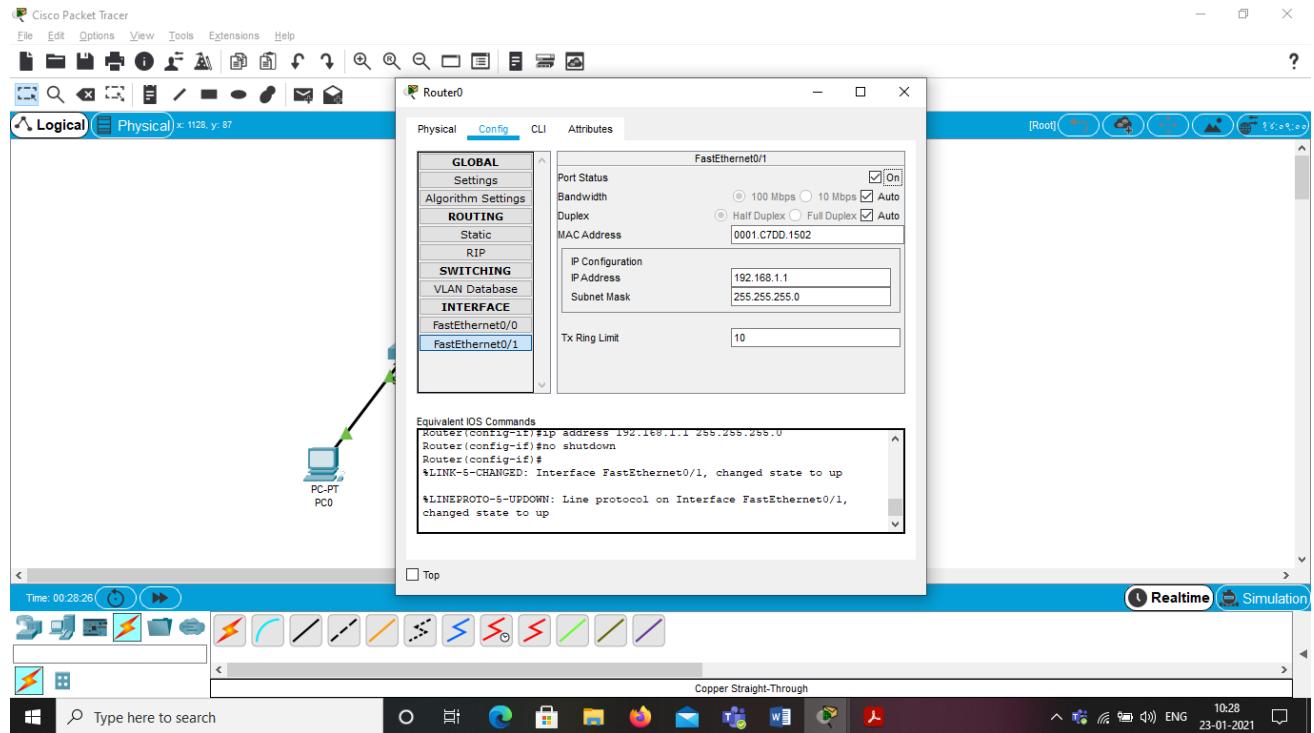

### Step 3: Assign the IP address for router

Assign the gateway address of 1<sup>st</sup> network and don't forget to turn on the port status

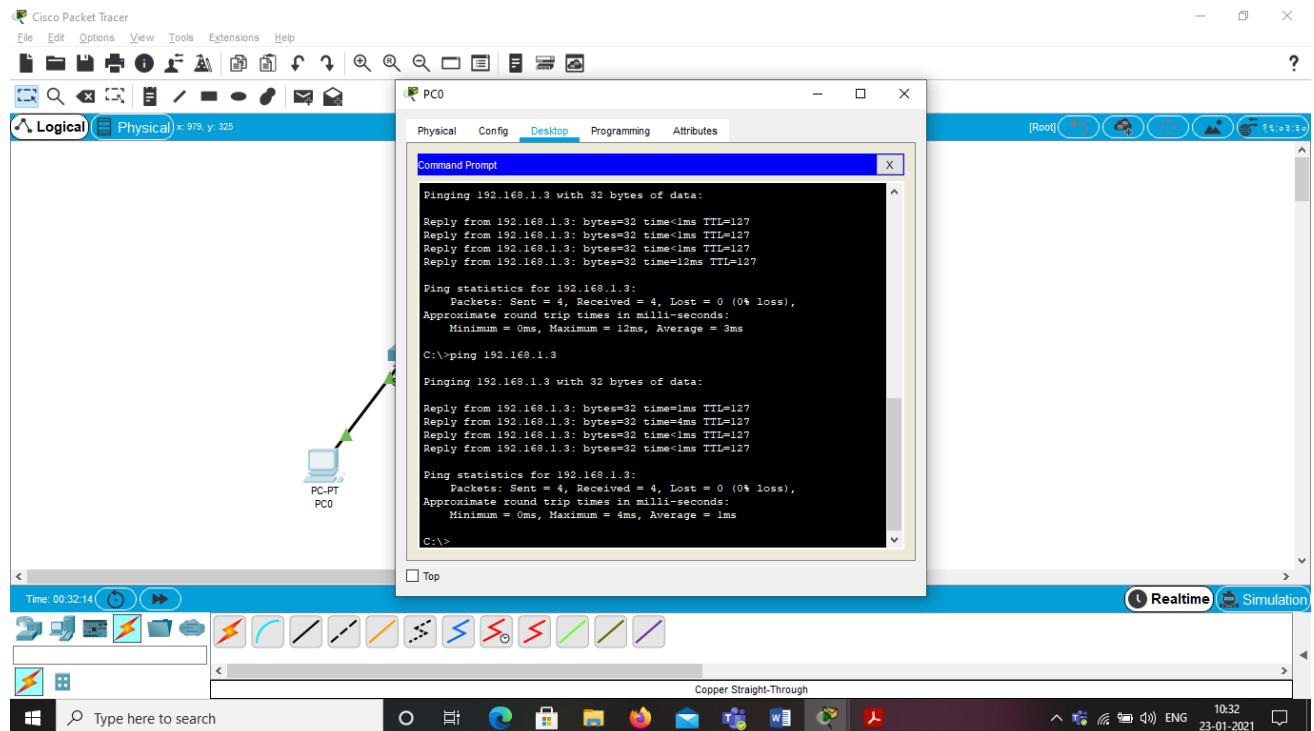

Assign the gateway address of 2<sup>nd</sup> network for FastEthernet0/1 interface

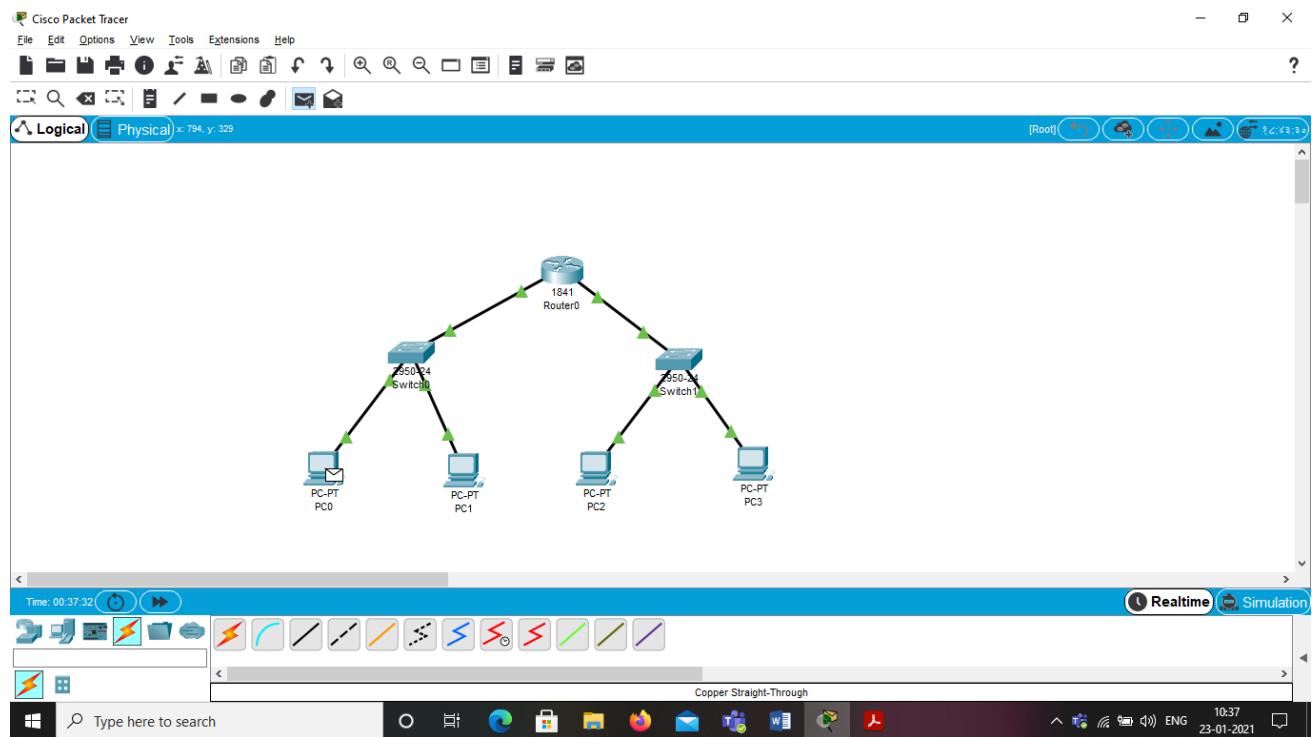

### Step 3: Check the connectivity from one network to another network

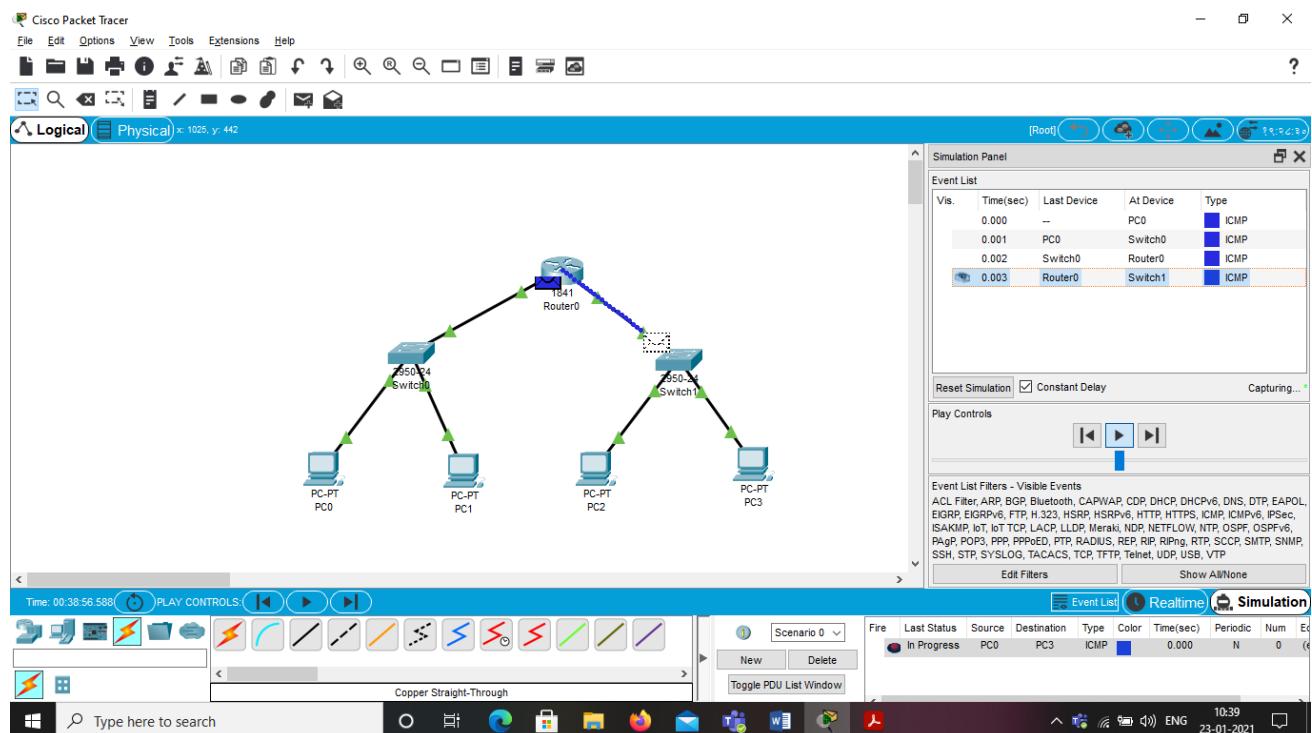

Select any PC from 1<sup>st</sup> network go to Desktop tab->Command Prompt->execute ping command for the 2<sup>nd</sup> network.

### Step 4: Send Simple PDU.

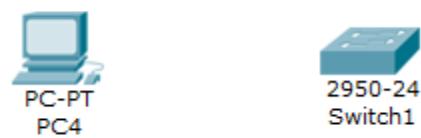

## Step 5: Check in simulation mode

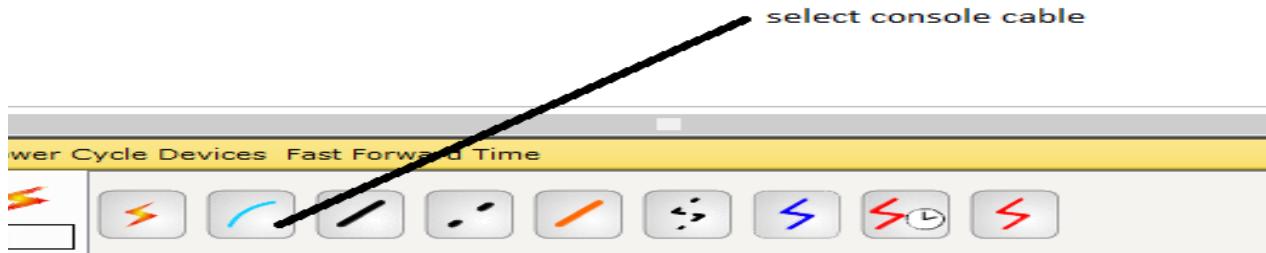

## **Exp 2: Configuration of Switch using cisco packet tracer**

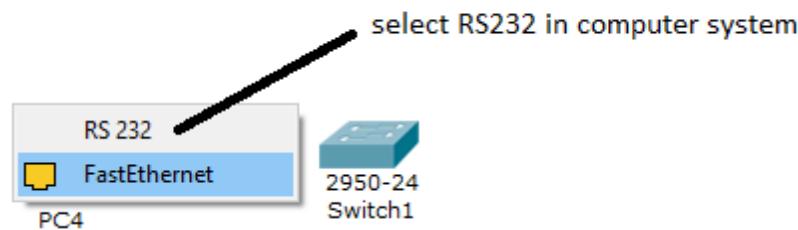

**Step 1:**

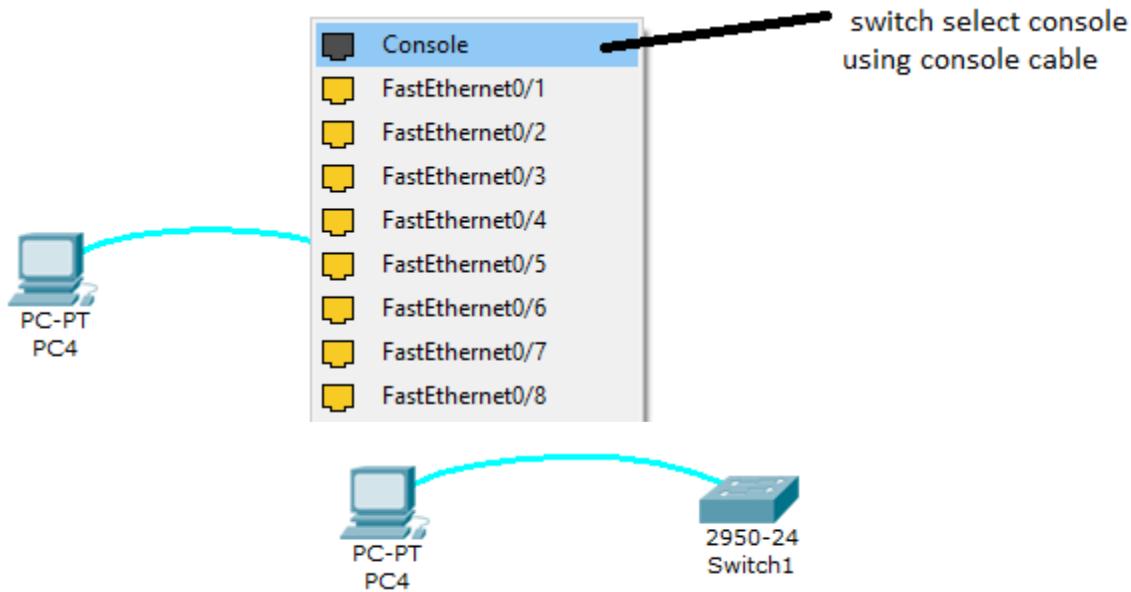

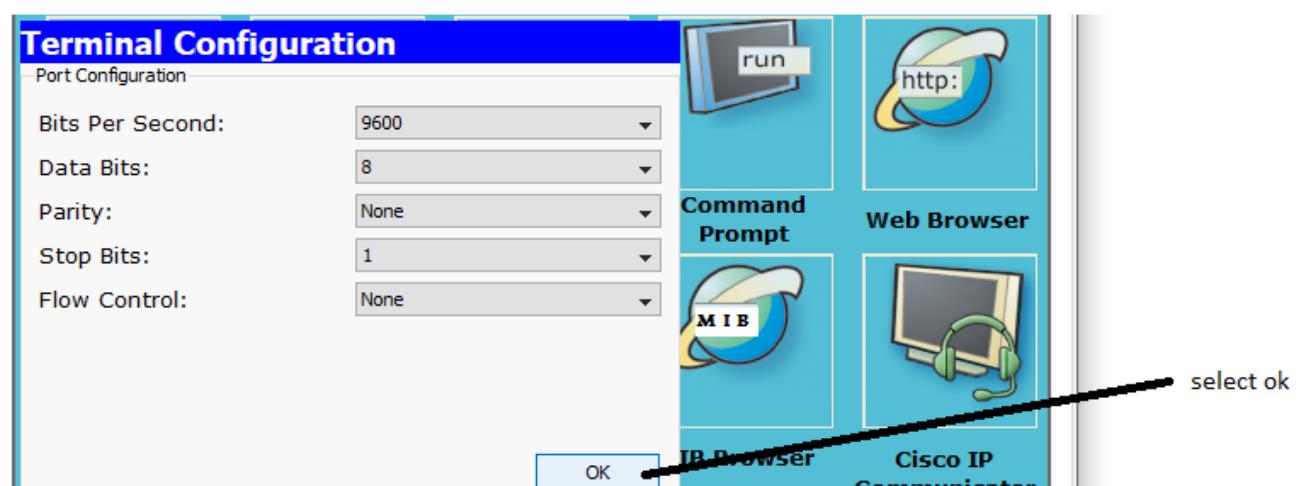

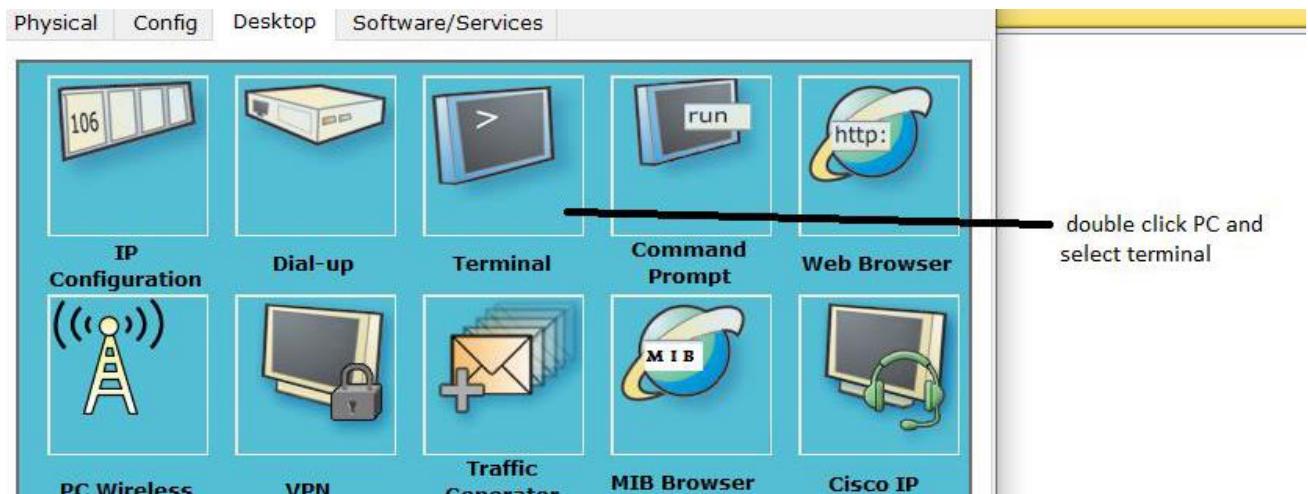

Step 2:

Step 3:

Step 4:

### Basic commands:

switch> ---> User Mode

switch>enable --> Enters into the Privilege mode

switch# --> Privilege mode

switch# configure terminal (or) conf t --> Enable Configuration Mode

switch(config)# --> Configuration Mode

Helping commands

switch> ? --> Help to list the available commands in this mode

switch>te? --> Lists all the commands starts with "tel"

switch# ? --> Help

### **Step 1: Erase the startup configuration file from NVRAM.**

Type the erase startup-config command to remove the startup configuration from nonvolatile random access memory (NVRAM).

Switch # erase startup-config

Erasing the nvram filesystem will remove all configuration files! Continue? [confirm]

[OK]

Erase of nvram: complete

Router#

### **Step 2: Reload the switch.**

Issue the reload command to remove an old configuration from memory. When prompted to Proceed with reload, press Enter to confirm the reload. Pressing any other key will abort the reload.

switch# reload

Proceed with reload? [confirm]

\*Nov 29 18:28:09.923: %SYS-5-RELOAD: Reload requested by console. Reload Reason: Reload Command.

Note: You may receive a prompt to save the running configuration prior to reloading the router. Respond by typing no and press Enter.

System configuration has been modified. Save? [yes/no]: no

### **Step 3:**

Use the show flash command to determine if any VLANs have been created on the switch.

Switch# show flash

Directory of flash:/

2 -rwx 1919 Mar 1 1993 00:06:33 +00:00 private-config.text

3 -rwx 1632 Mar 1 1993 00:06:33 +00:00 config.text

4 -rwx 13336 Mar 1 1993 00:06:33 +00:00 multiple-fs

5 -rwx 11607161 Mar 1 1993 02:37:06 +00:00 c2960-lanbasek9-mz.150-2.SE.bin

6 -rwx 616 Mar 1 1993 00:07:13 +00:00 vlan.dat

32514048 bytes total (20886528 bytes free)

Switch#

**Step 4**

Switch#

Switch> show version

Cisco IOS Software, C2960 Software (C2960-LANBASEK9-M), Version 15.0(2)SE, RELEASE SOFTWARE (fc1)

Technical Support: <http://www.cisco.com/techsupport>

Copyright (c) 1986-2012 by Cisco Systems, Inc.

Compiled Sat 28-Jul-12 00:29 by prod\_rel\_team

ROM: Bootstrap program is C2960 boot loader

BOOTLDR: C2960 Boot Loader (C2960-HBOOT-M) Version 12.2(53r)SEY3, RELEASE SOFTWARE

(fc1)

Switch uptime is 2 minutes

System returned to ROM by power-on

System image file is "flash://c2960-lanbasek9-mz.150-2.SE.bin"

<output omitted>

Which IOS image version is currently in use by your switch?

**Step 5 : Configure the clock.**

As you learn more about networking, you will see that configuring the correct time on a Cisco switch can be helpful when you are troubleshooting problems. The following steps manually configure the internal clock of the switch.

a. Display the current clock settings.

Switch> **show clock**

\*00:30:05.261 UTC Mon Mar 1 1993

b. Configure the clock setting. The question mark (?) provides help and allows you to determine the expected input for configuring the current time, date, and year. Press Enter to complete the clock configuration.

Switch# **clock set ?**

hh:mm:ss Current Time

Switch# **clock set 15:08:00 ?**

<1-31> Day of the month

MONTH Month of the year

Switch# **clock set 15:08:00 Oct 26 ?**

<1993-2035> Year

Switch# **clock set 15:08:00 Oct 26 2012**

Switch#

\*Oct 26 15:08:00.000: %SYS-6-CLOCKUPDATE: System clock has been updated from 00:31:43

UTC Mon Mar 1 1993 to 15:08:00 UTC Fri Oct 26 2012, configured from console by  
console.

c. Enter the show clock command to verify that the clock setting has updated.

Switch# **show clock**

15:08:07.205 UTC Fri Oct 26 2012

#### **Step 6 : Give the switch a name.**

Use the hostname command to change the switch name to S1.

Switch(config)# **hostname S1**

S1(config)#

#### **Step 7:Enter a login MOTD banner.**

A login banner, known as the message of the day (MOTD) banner, should be configured to warn anyone accessing the switch that unauthorized access will not be tolerated. The banner motd command requires the use of delimiters to identify the content of the banner message. The delimiting character can be any character as long as it does not occur in the message. For this reason, symbols, such as the #, are often used.

S1(config)# **banner motd #**

Enter TEXT message. End with the character '#'

Unauthorized access is strictly prohibited and prosecuted to the full extent of the law. #

S1(config)# exit

S1#

**Step 8: Save the configuration.**

Use the copy command to save the running configuration to the startup file on non-volatile random access memory (NVRAM).

**S1# copy running-config startup-config**

Destination filename [startup-config]? [Enter]

Building configuration...

[OK]

S1#

**Step 9 : Display the current configuration.**

The show running-config command displays the entire running configuration, one page at a time. Use the spacebar to advance paging.

S1# show running-config

Building configuration...

Current configuration : 1409 bytes

!

! Last configuration change at 03:49:17 UTC Mon Mar 1 1993

**Step 10 : Display the status of the connected interfaces on the switch.**

To check the status of the connected interfaces, use the show ip interface brief command. Press the spacebar to advance to the end of the list.

**S1# show ip interface brief**

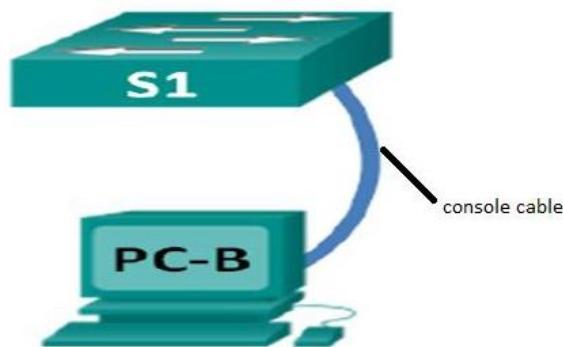

Interface IP-Address OK? Method Status Protocol  
Vlan1 unassigned YES unset up up  
FastEthernet0/1 unassigned YES unset up up  
FastEthernet0/2 unassigned YES unset down down  
FastEthernet0/3 unassigned YES unset down down  
FastEthernet0/4 unassigned YES unset down down  
FastEthernet0/5 unassigned YES unset down down

```
FastEthernet0/6 unassigned YES unset up up  
FastEthernet0/7 unassigned YES unset down down  
FastEthernet0/8 unassigned YES unset down down  
FastEthernet0/9 unassigned YES unset down down
```

**Step 11: Show vlan:**

Show vlan command will display the VLANs. For administrative purpose, switch automatically create VLAN 1 and assign all its interfaces to it. You can create custom VLANs from global configuration mode and then assign them to interfaces.

### **Exp 3: Configure the privilege level password and user authentication in switch.**

#### **I How to Set Hostname and Configure Console Password**

##### **1. To set the host name**

```
Switch(config)# hostname CISCO
```

##### **2. To set console password**

```
CISCO( config)#
```

```
CISCO( config)#line console 0
```

```
CISCO( config-line)#password cisco123
```

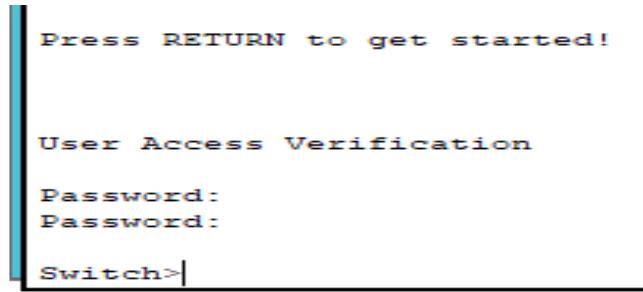

```
CISCO( config-line)#login
```

```
CISCO( config-line)#exit
```

```
CISCO( config)#exit
```

```
CISCO#exit
```

Check the Console Password

## II How to Set Privilege level password

### **1)Set a privilege password**

!!! Clear Text Password not encrypted(less priority)

```
CISCO(config)# enable password muscat
```

!!! Encrypted password (more Priority)

```
CISCO(config)# enable secret nizwa
```

### **2) Verify the privilege Password**

```
CISCO(config)# exit
```

```
CISCO# exit
```

CISCO con0 is now available

Press RETURN to get started.

User Access Verification

!!! TYPE HERE LINE CONSOLE Password

Password:

```
CISCO>enable
```

!!! TYPE HERE Privilege Level Password

Password:

## III How to Set User Authentication in Switch

### **1)Set user authentication**

```
CISCO# conf t
```

```
CISCO(config)# line console 0
```

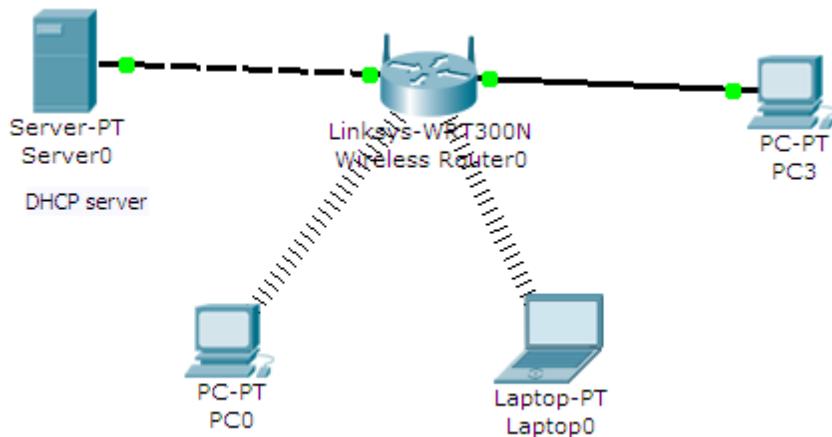

```
CISCO(config-line)# login local
```

```
CISCO(config-line)# exit  
CISCO(config)#username network password pwd
```

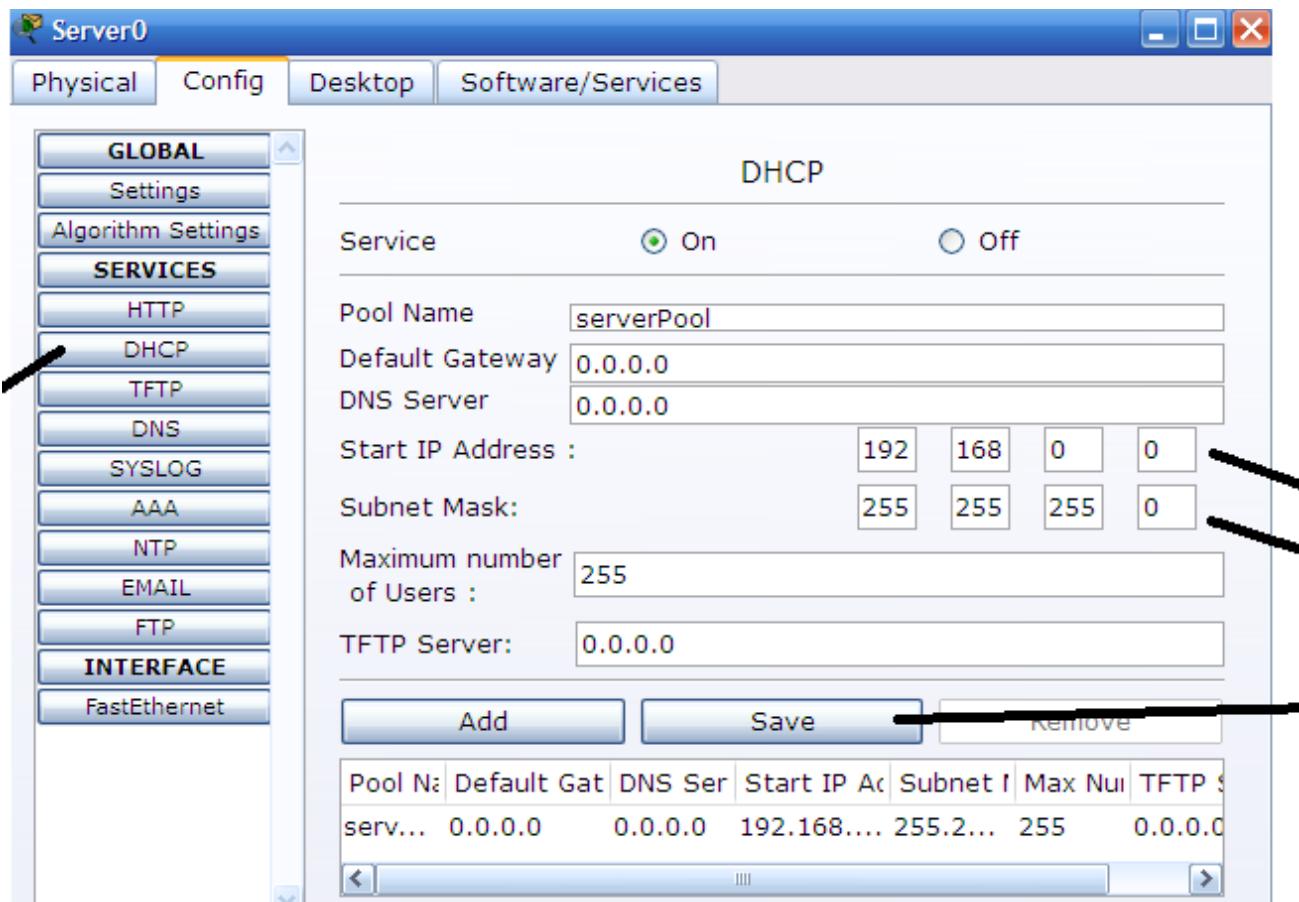

## 2) Verify the Authentication

```
CISCO(config)# exit  
CISCO# exit  
User Access Verification  
Username: network  
Password:  
CISCO> enable  
Password:
```

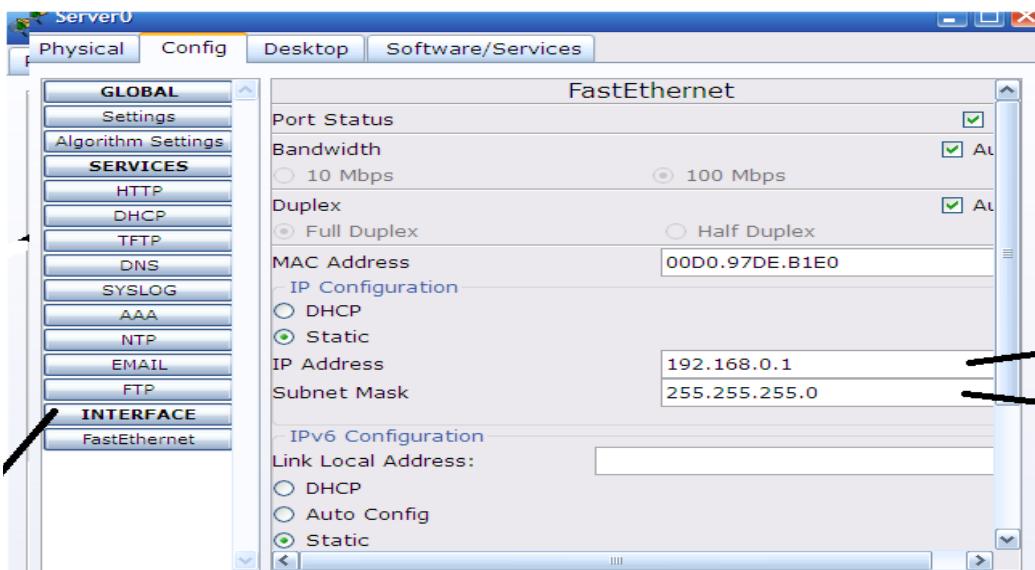

### Exp 4: Configure the DHCP Server and wireless router and check the connectivity

Step1 :configure the DHCP server

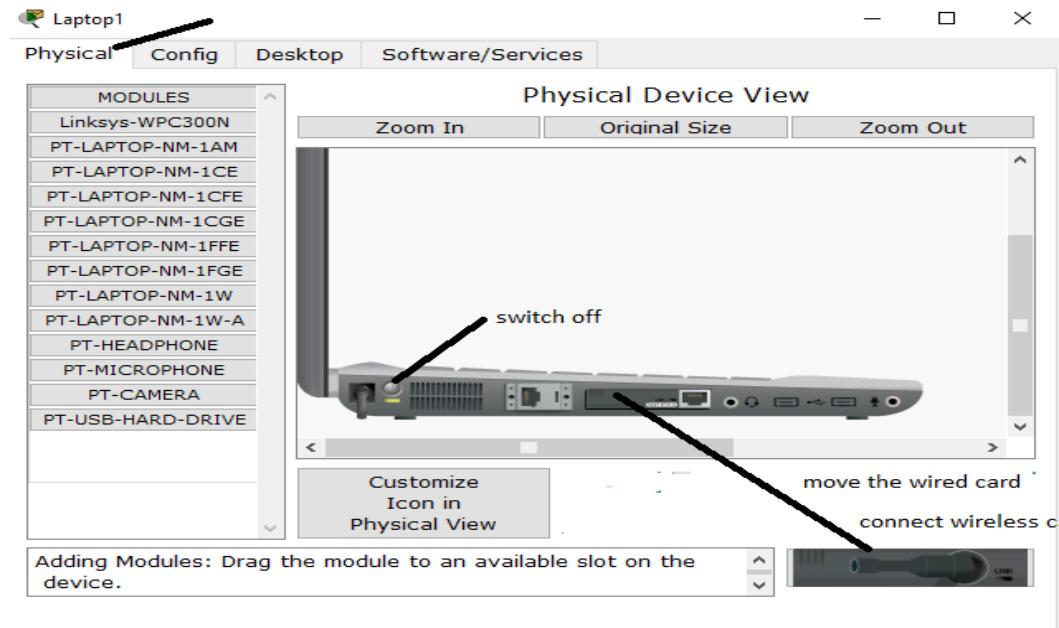

Step2: In server configure the fast Ethernet

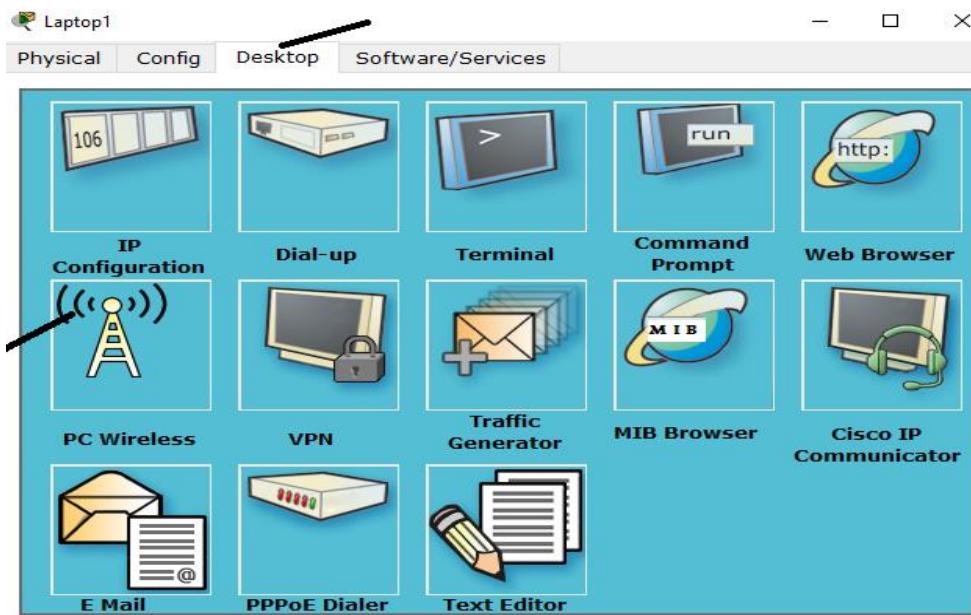

Step 3: configure the wireless router

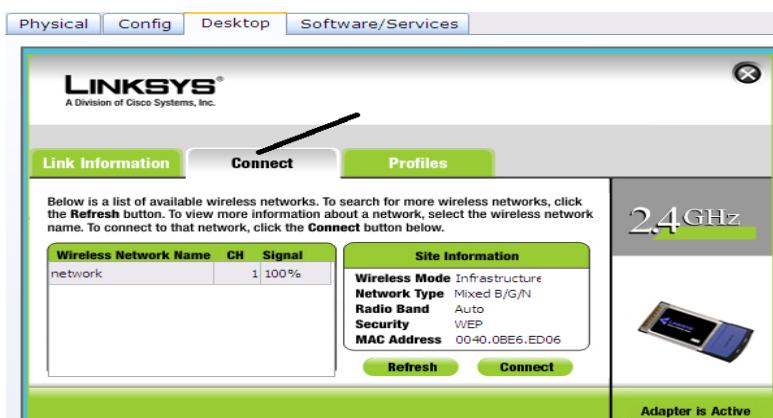

Step4 :Laptop remove the wired NIC card to wireless card

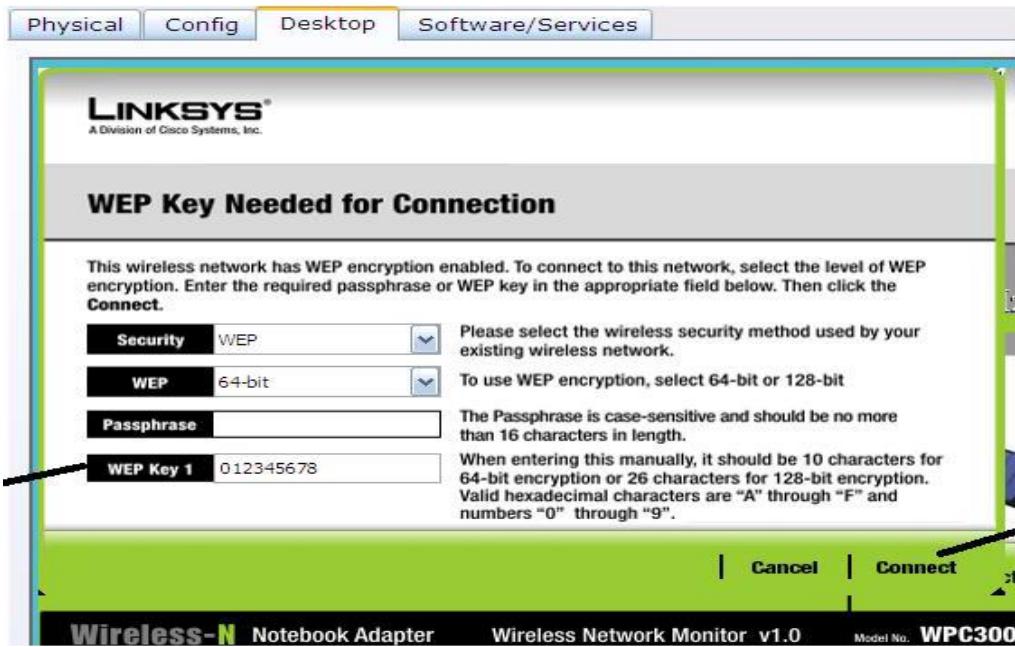

Step 5: Laptop connect the wireless

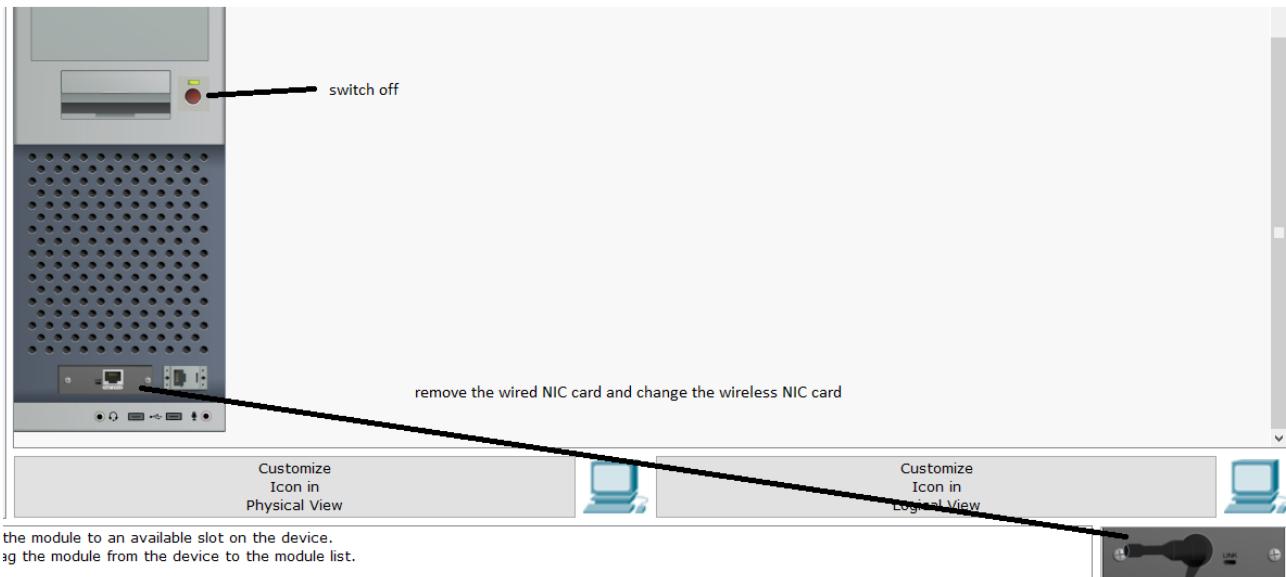

### Step 6 : connect Laptop with wireless router

### Step 7 :enter web key

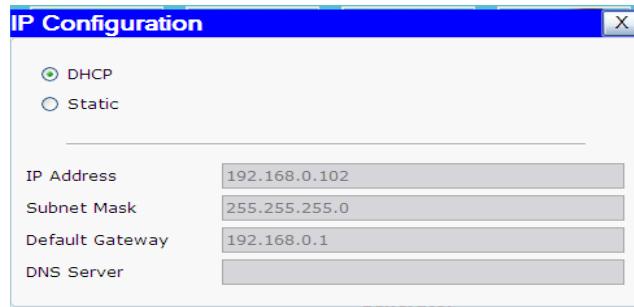

Step8 : PC remove the wired NIC card to wireless card

Note : Same steps 5,6,7

Step 9 : check the Pc and laptop for the DHCP ip address

Step10 check the connectivity

```
Packet Tracer PC Command Line 1.0
PC>
Packet Tracer PC Command Line 1.0
PC>
Packet Tracer PC Command Line 1.0
PC>ping 192.168.0.101

Pinging 192.168.0.101 with 32 bytes of data:

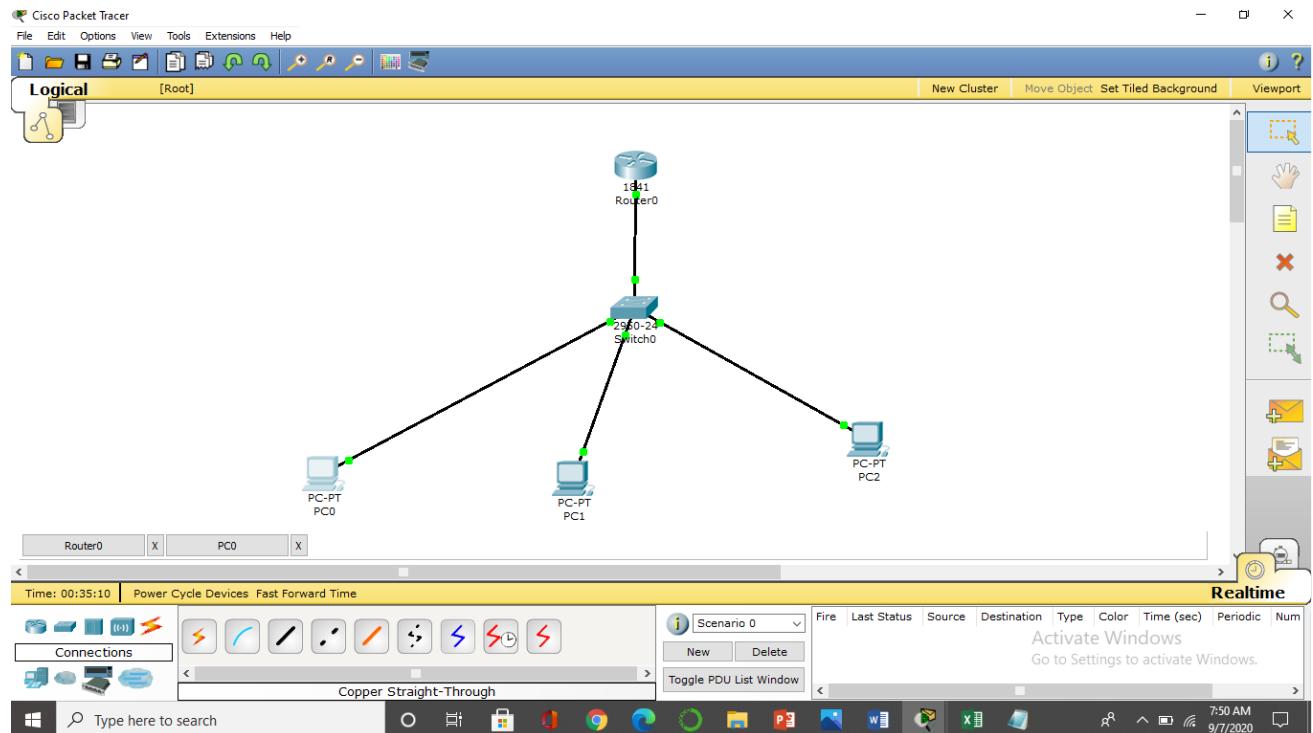

Reply from 192.168.0.101: bytes=32 time=94ms TTL=128
Reply from 192.168.0.101: bytes=32 time=93ms TTL=128
Reply from 192.168.0.101: bytes=32 time=94ms TTL=128
Reply from 192.168.0.101: bytes=32 time=94ms TTL=128

Ping statistics for 192.168.0.101:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 93ms, Maximum = 94ms, Average = 93ms

```

## Exp 5: Configure the telnet protocol using cisco packet tracer

Step 1: Draw a topology as shown below and assign IP address to all PC's.

### Step 2: Configure IP address to router.

```
Router(config)#interface FastEthernet0/0
```

```
Router(config-if)#ip address 10.0.0.1 255.0.0.0
```

```
Router(config-if)#no shutdown
```

```
Router(config-if)#exit
```

**Step 3:To set privilege mode password**

Click on Router and go to CLI tab and type below.

```
Router(config)#enable password 1234
```

```
Router(config)#exit
```

**Step 4:To configure telnet.**

```
Router#conf t
```

Enter configuration commands, one per line. End with CNTL/Z.

```
Router(config)#line vty 0 4
```

```
Router(config-line)#password cisco
```

```
Router(config-line)#login
```

```
Router(config-line)#exit
```

**Step 5:To check telnet configuration.**

```
Router#sh run
```

## Exp 6: Configure the static routing using cisco packet tracer.

Step 1: Draw a topology as shown below and assign IP address to all PC's.

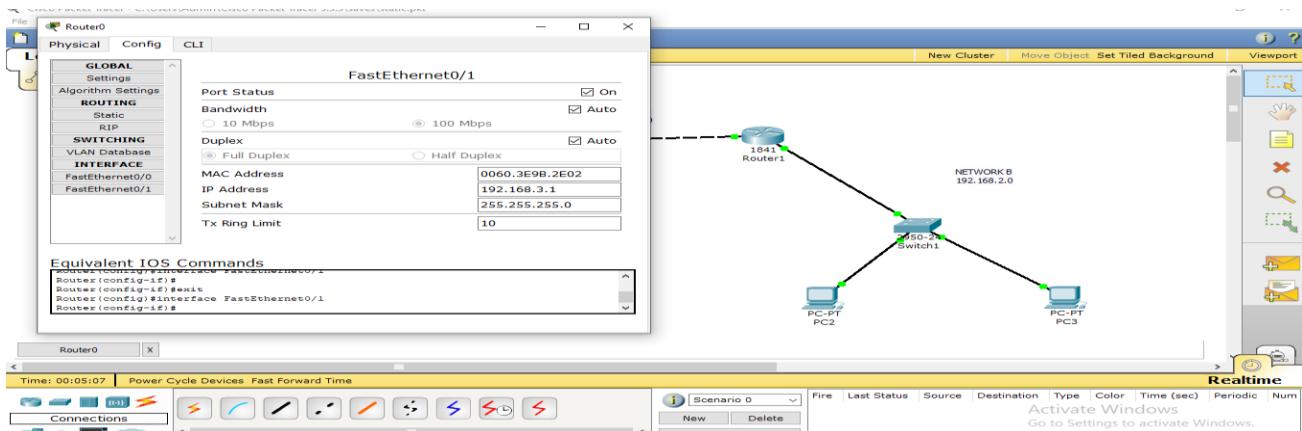

## Step 2: Configure IP address to router1.

For Fastethernet 0/0

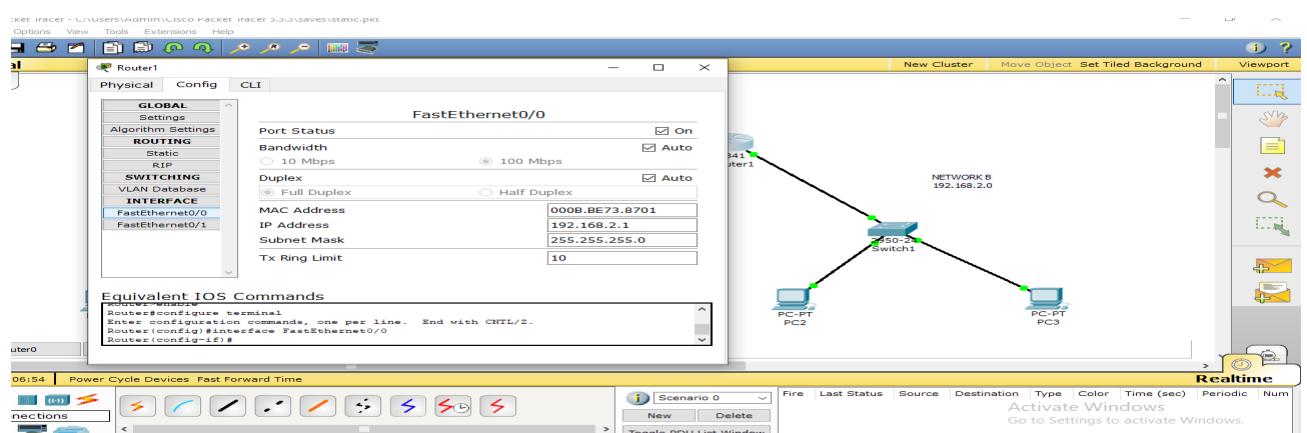

For Fastethernet 0/1

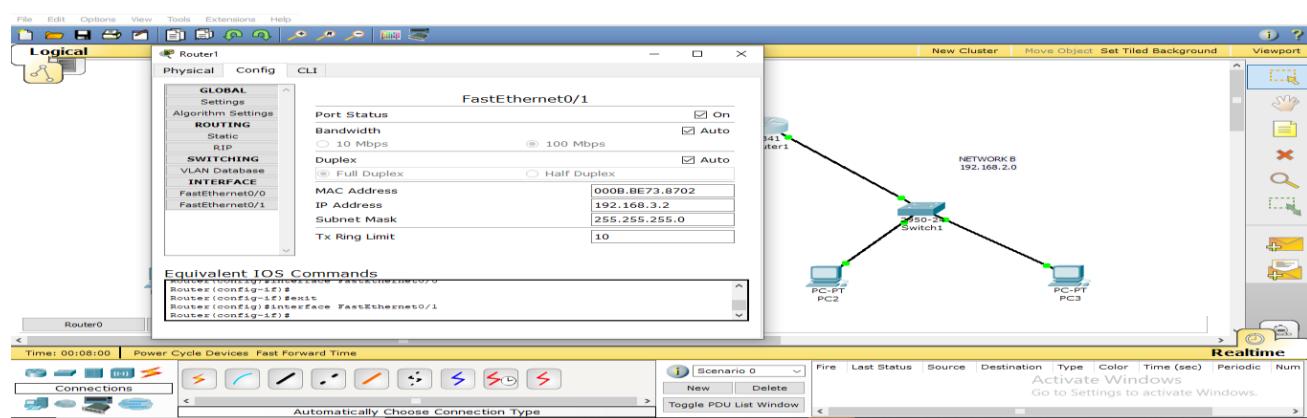

### Step 3 :Configure IP address to router2

For Fastethernet 0/0

For FastEthernet 0/1

### Step 4:To set up Static Routing

For Router 1:

In CLI:

Router(config)#

Router(config)#ip route 192.168.2.0 255.255.255.0 192.168.3.2

In Config Window:

Click on Static

Then Add Opposite Network Address 192.168.2.0 and Next Hop address 192.168.3.1 Along with Subnet Mask Address 255.255.255.0

For Router 2:

In CLI:

Router(config)#

Router(config)#ip route 192.168.1.0 255.255.255.0 192.168.3.1

In Config Window:

Click on Static

Then Add Opposite Network Address 192.168.1.0 and Next Hop address 192.168.3.2 Along with Subnet Mask Address 255.255.255.0

### **Step 5 :To Check Connectivity between two network using Static Routing**

Click on any PC>click on desktop>select command prompt and then type below commands

PC>ping 192.168.2.1

Pinging 192.168.2.1 with 32 bytes of data:

Reply from 192.168.2.1: bytes=32 time=147ms TTL=254

Reply from 192.168.2.1: bytes=32 time=84ms TTL=254

Reply from 192.168.2.1: bytes=32 time=100ms TTL=254

Reply from 192.168.2.1: bytes=32 time=100ms TTL=254

Ping statistics for 192.168.2.1:

    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),

    Approximate round trip times in milli-seconds:

        Minimum = 84ms, Maximum = 147ms, Average = 107ms

```

PC1
Physical Config Desktop Software/Services

Command Prompt
Packet Tracer PC Command Line 1.0
PC>ping 192.168.2.1

## Exp 7: Configure the RIP routing using cisco packet tracer.

Step 1: Draw a topology as shown below and assign IP address to all PC's.

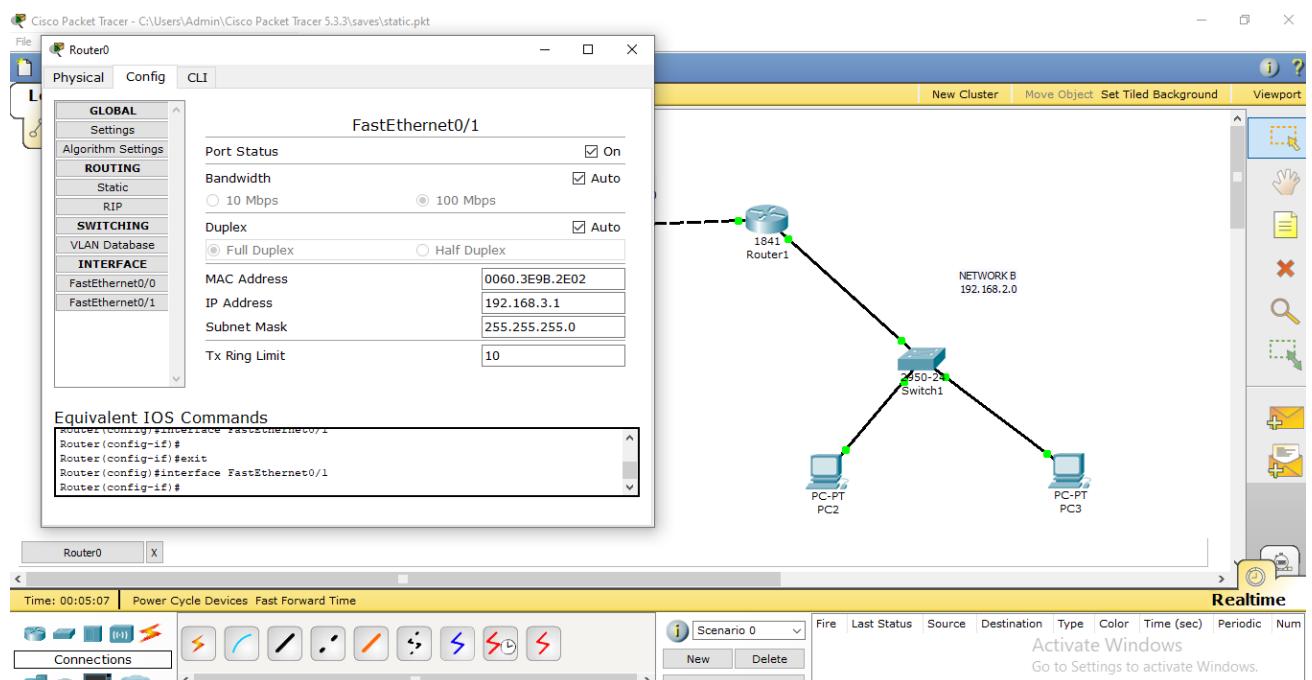

Step 2: Configure IP address to router1.

For Fastethernet 0/0

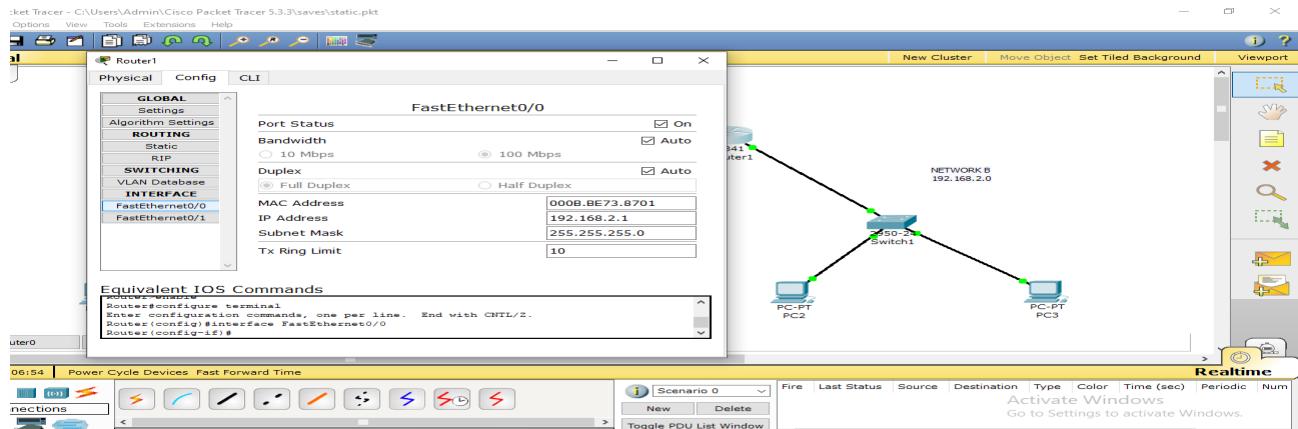

For Fastethernet 0/1

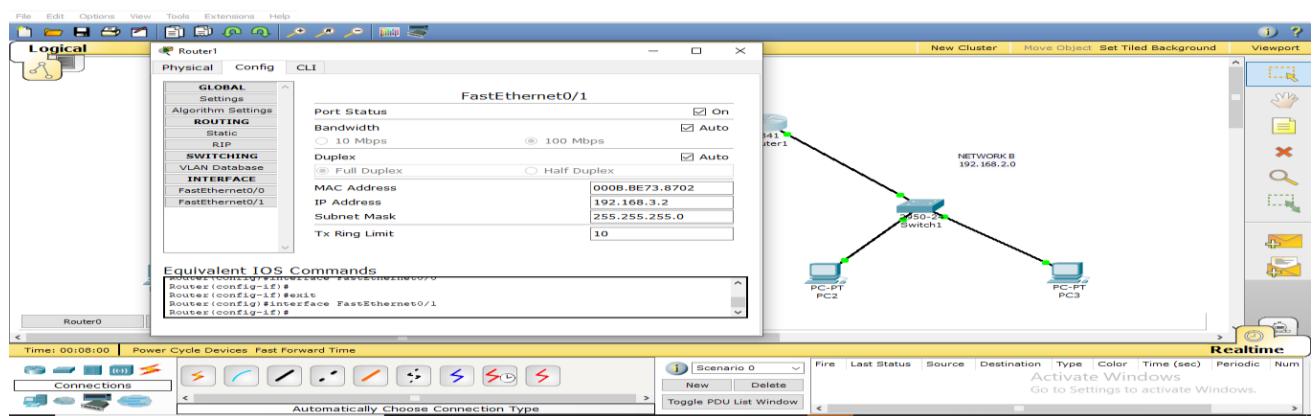

### Step 3 :Configure IP address to router2

For Fastethernet 0/0

For FastEthernet 0/1

#### Step 4: To set up Dynamic Routing

For Router 1:

In CLI:

```
Router(config)#router rip
```

```
Router(config-router)#network 192.168.3.0
```

```
Router(config-router)#network 192.168.2.0
```

In Config Window:

Click on RIP

Then Add Opposite Network Address 192.168.2.0 and 192.168.3.0

For Router 2:

In CLI:

```
Router(config)#router rip
```

Router(config-router)#network 192.168.3.0

Router(config-router)#network 192.168.1.0

In Config Window:

Click on RIP

Then Add Opposite Network Address 192.168.1.0 and 192.168.3.0

### Step 5 :To Check Connectivity between two network using RIP routing

Click on any PC>click on desktop>select command prompt and then type below commands

PC>ping 192.168.2.1

Pinging 192.168.2.1 with 32 bytes of data:

Reply from 192.168.2.1: bytes=32 time=147ms TTL=254

## **Exp 8: Configure the Static NAT using cisco packet tracer.**

NAT(NETWORK ADDRESS TRANSLATION)

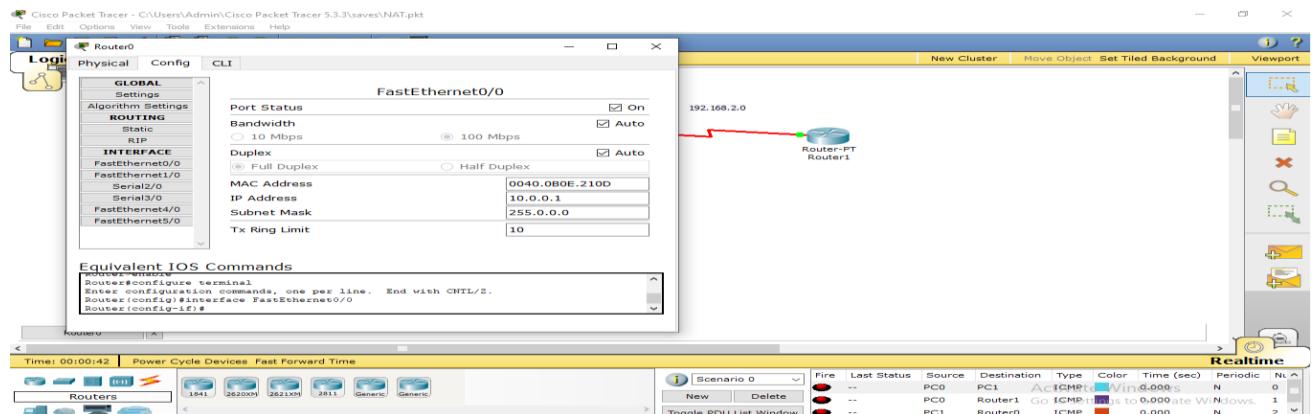

It is a Process in which one or more Local ip address is translated into global ip address or vice versa in order to provide internet access to the host. It Allows multiple devices to access internet through single public ip address.

Step 1: Draw a topology as shown below and assign IP address to all PC's.

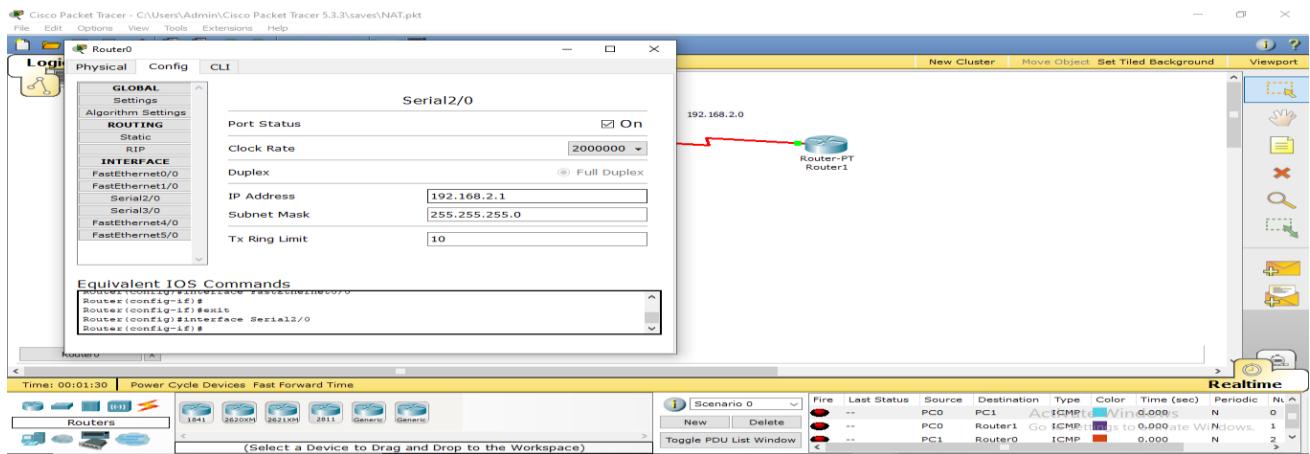

## Step 2: Configure IP address to router1.

For Fastethernet 0/0

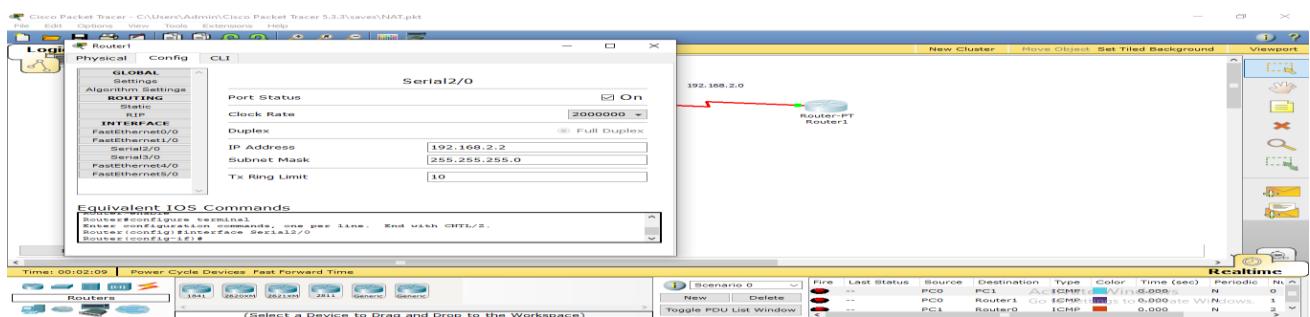

For Serial2/0

### Step 3 :Configure IP address to router2

For Serial 2/0

### Step 4:To set up Static NAT:

Router# sh ip nat translation

Router# config t

Router(config)#ip nat inside source static 10.0.0.2 192.168.1.3

Provide interface for NAT cable

Router(config)# int fa0/0

Router(config-if)# ip nat inside

exit

Router(config)# int serial2/0

Router(config-if)# ip nat outside

exit

exit

Router#sh ip nat translation

### Step 5 :To Check Connectivity between two network

Click on any PC>click on desktop>select command prompt and then type below commands

PC>ping 192.168.2.1

Pinging 192.168.2.1 with 32 bytes of data:

Reply from 192.168.2.1: bytes=32 time=147ms TTL=254

Reply from 192.168.2.1: bytes=32 time=84ms TTL=254

Reply from 192.168.2.1: bytes=32 time=100ms TTL=254

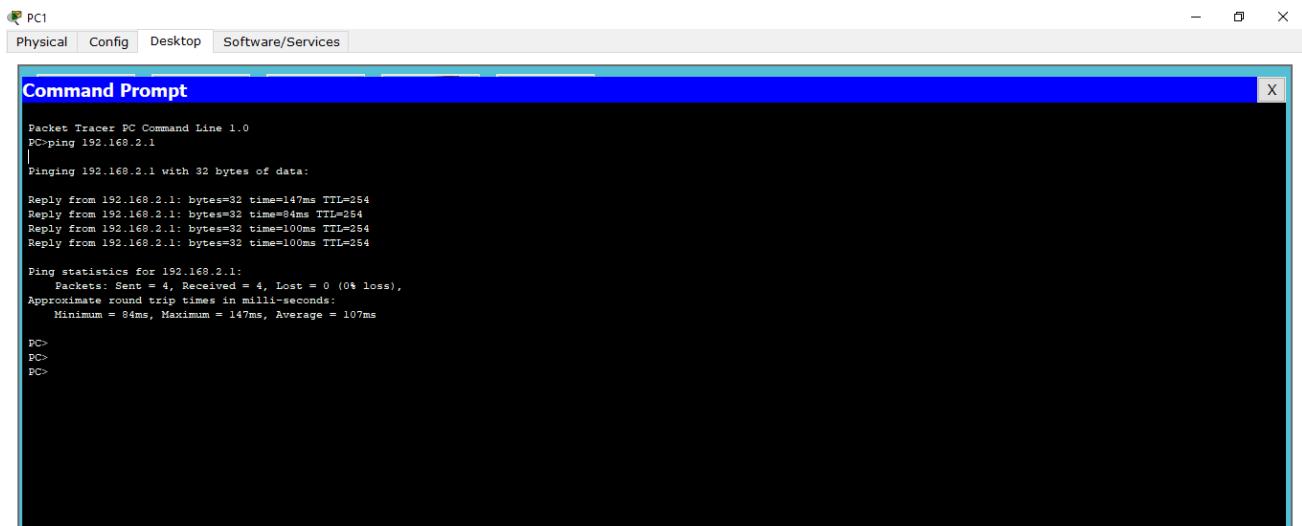

Reply from 192.168.2.1: bytes=32 time=100ms TTL=254

Ping statistics for 192.168.2.1:

Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),

Approximate round trip times in milli-seconds:

Minimum = 84ms, Maximum = 147ms, Average = 107ms

```
PC1

## **Exp 9: Configure the Dynamic NAT using cisco packet tracer.**

### NAT(NETWORK ADDRESS TRANSLATION)

It is a Process in which one or more Local ip address is translated into global ip address or vice versa in order to provide internet access to the host.

It Allows multiple devices to access internet through single public ip address.

Dynamic NAT configuration requires four steps: -

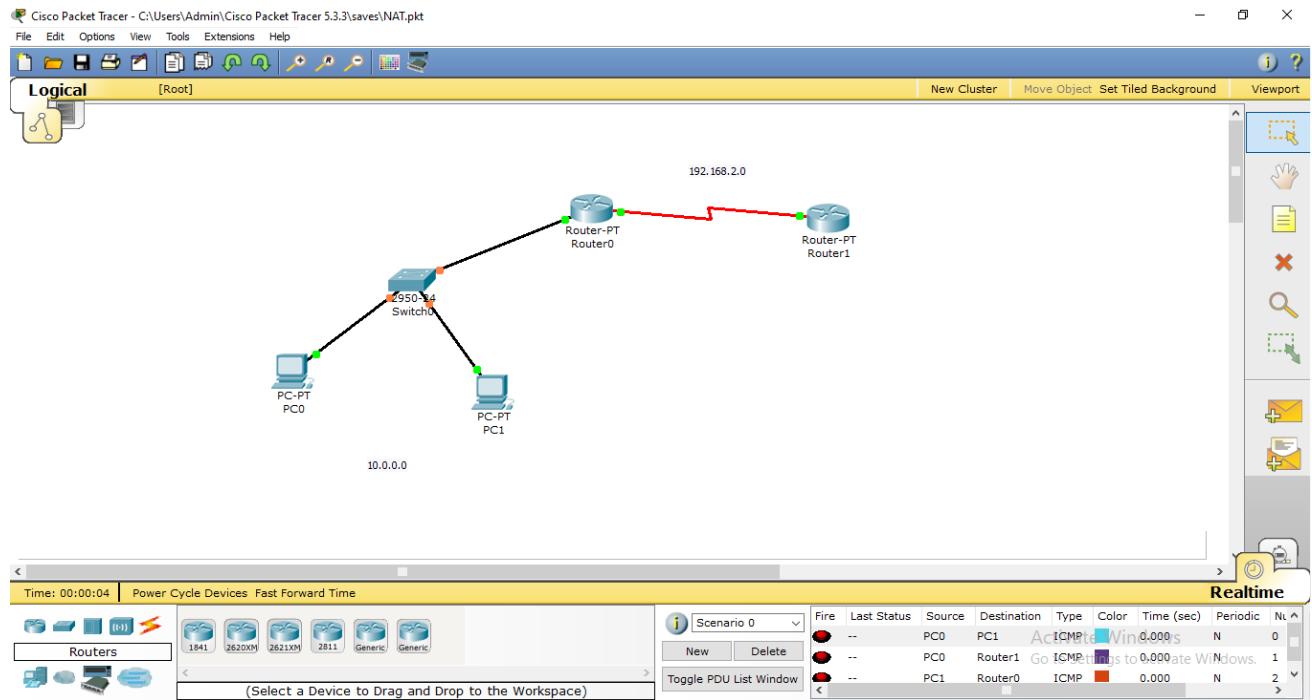

Step1: Create an access list of IP addresses which need translation(ACL range 1 to 99 and 1300 to 1999)

Step2 : Create a pool of all IP address which are available for translation

Step3: Map access list with pool

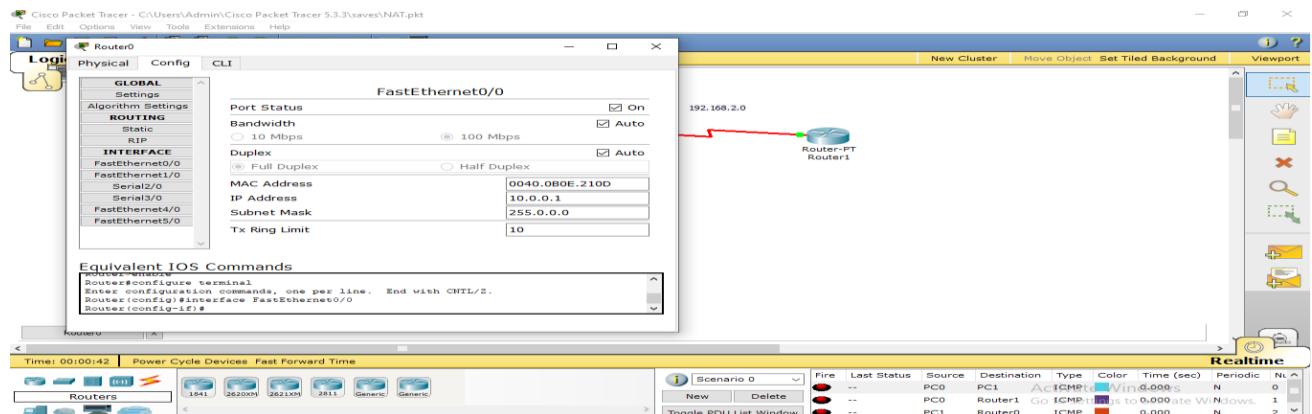

Step4: Define inside and outside interfaces

**Step 1: Draw a topology as shown below and assign IP address to all PC's.**

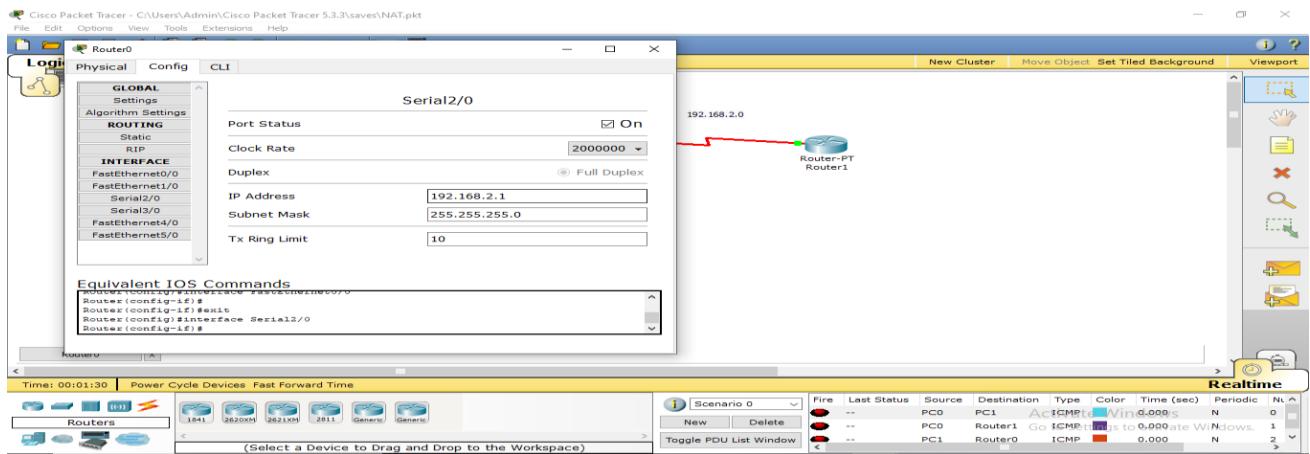

## Step 2: Configure IP address to router1.

For Fastethernet 0/0

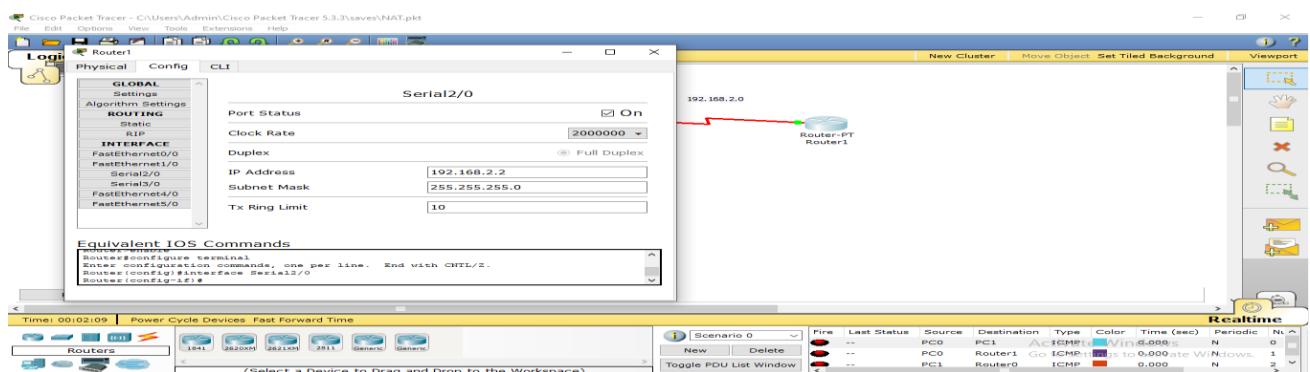

For Serial2/0

### Step 3 :Configure IP address to router2

For Serial 2/0

### Step 4:To set up Dynamic NAT:

router(config)#access-list 1 permit 10.0.0.2 0.0.0.0

router(config)#access-list 1 permit 10.0.0.3 0.0.0.0

router(config)#ip nat pool nslab 192.168.2.3 192.168.2.4 netmask 255.255.255.0

router(config)#ip nat inside source list 1 pool nslab

router(config)#int fa0/0

router(config-if)#ip nat inside

router(config-if)#exit

router(config)#int serial2/0

router(config-if)ip nat outside

router#sh ip nat translation

### Step 5 :To Check Connectivity between two network

Click on any PC>click on desktop>select command prompt and then type below commands

PC>ping 192.168.2.1

Pinging 192.168.2.1 with 32 bytes of data:

Reply from 192.168.2.1: bytes=32 time=147ms TTL=254

Reply from 192.168.2.1: bytes=32 time=84ms TTL=254

Reply from 192.168.2.1: bytes=32 time=100ms TTL=254

Reply from 192.168.2.1: bytes=32 time=100ms TTL=254

Ping statistics for 192.168.2.1:

Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),

Approximate round trip times in milli-seconds:

Minimum = 84ms, Maximum = 147ms, Average = 107ms
